Passing on now to consider in outline the Kenmare and Headford Railway, situated also in Kerry, and likewise being constructed by the Great Southern and Western Railway Company of Ireland as an offshoot from their main system, we find work of very similar character, traversing a district hardly less remarkable for the grandeur of its surroundings. The Kenmare and Headford line is also being built under subvention from and by arrangement with the Imperial Government, and has a total length of nearly twenty miles. Starting from Kenmare, a town of about fourteen hundred inhabitants, and famous for the excellent salmon-fishing on the Blackwater, which falls into the bay some six miles below, the line takes a northerly direction, and with a rising gradient, crosses the Cleady River, and after several cuttings, the Caher River. The gradient now begins to descend, the line following very closely the natural level of the country, with small banks and cuttings rapidly alternating. This type of work is continued all the way until the parish of Kilgarvan is reached, and calls for no special remark, sundry minor streams and roads being met and crossed in the usual manner. The Flesk Valley, up which the line winds on its way to Headford, presents many points of remarkable mountain scenery. Public road and railway follow a very similar route beneath the gigantic crags which shut in the valley, and whose bold and rocky outlines form fitting theme for the lover of nature.

The line, as we have said, is laid out to follow the natural surface of the district as closely as possible, and this remark extends all the way through Crohane and Rossacroonalloo until the river Flesk is reached and passed; the Loo River, a still deep stream, abounding in trout, and covered with water-lilies, having been previously crossed no less than six times. The line again follows a level course, and after crossing a stretch of bogland, passes over the Owenacree River, and then traversing some cuttings, finally, after a short horizontal length, forms connection with the Great Southern and Western Railway near Headford, in the parish of Aghadoe.

Having now, in brief outline, followed the route traversed by each of these two important undertakings, we pass to some consideration of the special features of interest common to both, and undoubtedly the crossing of the bogs deserves some special notice. The difficulties encountered by Stephenson in throwing a railway across Chat Moss are familiar to our readers, no less than the methods by which he overcame the treacherous bog. The execution of similar work, and the triumph over like obstacles at the present time in South Ireland, are worthy of some scant description.

A bog has an average depth of about twenty-five feet, and the peat composing it varies in colour according to the depth from whitish brown to a brown black not unlike coal, the brown or

red turf in the centre forming the best fuel. The first step in dealing with the bog is to drain it, a work occupying many months. Trenches are cut parallel to the railway; shorter cross-trenches being provided at intervals. All the trenches are carefully tended and gradually deepened, as the unwatering of the peat proceeds, resulting in a fall of surface of no less than five or six feet when the bog is dried. This accomplished, a layer of bushes, brushwood, &c. is laid down along the route, and covered with a dressing of stiff clay some two feet or more in thickness. On this bedding are laid the top ballast and sleepers supporting the rails, and thus the line is successfully floated over the bog. The crossing of bogs is work the engineer in the British Isles is not frequently called upon to undertake, hence the interest attaching to the foregoing examples of somewhat novel requirements.

Both undertakings are single lines throughout, and are constructed to the customary Irish gauge, five feet three inches, permitting free interchange of traffic with their parent system. The bridges, culverts, retaining walls, and cattle-passes are built either of concrete or of the stone quarried on the lines in forming cuttings, no brickwork being used. The fence-walls are formed mostly of turf, being built up from the sods cut from the ground traversed. These rapidly consolidate and grow green in the soft moist climate of Kerry, and form picturesque and pleasing boundaries. A stout post-and-wire fencing surmounts each bank.

Huts have been erected at intervals along the lines, with stores attached, for the accommodation of the men; whilst so difficult has it been found to house the staff, that the railway stations—neat structures of wood and iron—and the level-crossing cottages, have already been constructed, to provide quarters during the carrying out of the undertakings.

Work was commenced at the beginning of the current year, and has since been vigorously prosecuted at all points. The lines are throughout being constructed in the most solid and approved manner, and reflect credit on engineers and contractors alike.

WAYSIDE FLOWERS.

I LOVE the flowers whose softly-tinted faces
By dusty road or hedgeside meet the gaze,
Clothing with beauty Earth's unlovely places,
Freshest and sweetest in Life's common ways.
Their mission is so lofty, yet so lowly—
Brightening the rugged paths of daily toil,
Their lesson is so simple, yet so holy—
Such gracious growths may spring from stony soil!
Hands, labour worn, which have but little leisure,
Pause in their work these untrained blooms to cull;
World-weary hearts throb fast again with pleasure
At sight of things so pure and beautiful.
Through dust and mire their stainless petals glisten;
They choose the world's waste ground to make it fair;
And whisper in the ear that stoops to listen:
'Sweetness and grace may flourish everywhere.'

MOROCCO: THE LAND OF MULAI EL HASSAN.

By DR ROBERT BROWN.

'WITHIN sight of an English fort, and within hail of English ships as they pass to our Empire in the East, there is a land where the ways of life are the same as they were a thousand years ago: a land wherein government is oppression: where law is tyranny: wherein justice is bought and sold: wherein it is a terror to be rich and a danger to be poor: wherein man may still be the slave of man, and woman is no more than a creature of lust—a reproach to Europe, a disgrace to the century, an outrage on humanity, a blight on religion: that land is Morocco.' These are the words with which an eminent novelist begins a romance of Al Islam in Northern Africa; and excepting, possibly, the sweeping conclusions with which the indictment terminates, they are just from the European point of view, and perfectly accurate from whatever aspect they are regarded.

But the Empire of Mulaï el Hassan is not that of Queen Victoria; and Tangier, where most visitors obtain their sole glimpse of the country, is not to be criticised from the meridian of London. It is a Moorish city; and if such a state of matters pleases its owners, we have no more right to call down fire from heaven upon them than have the Moors to inveigh against the scandalous condition of the English capital—a pious duty, seldom neglected by the few who have visited it. And whatever may be doubtful in the external economy of Morocco, it is quite certain that the inhabitants wish for no change which could in any way interfere with the peculiar institutions over which our novelist is so eloquently indignant, and for none of any description on the Unbelievers' model. They may not love the Sultan when the hands of his tax-gatherers wax heavy; and there are mountain tribes who never pay him their dues until he convinces them of their folly by the arguments of Krupp guns and a rabble army. The government is despotism tempered with anarchy. No

Emperor ever succeeds without having to engage in civil war with rivals for the throne. If the Sultan is not seen in the mosque any Thursday, the price of gunpowder immediately rises; for then they fear he is dead, and fighting must follow. Indeed, it may be affirmed, that though the Arabs have been in Morocco for more than twelve centuries, they have never yet fully conquered the country. The Berber tribes driven to the mountains by the invaders are still only imperfect Moslems, and only half subdued. In the Riff country they are all but independent; and in Sus, even the Arabs under a religious chief can at times give the army of the Sultan plenty of cruel work to do.

But 'Seedna Al Sooltan'—our Lord the Sultan—is the head of the Faith. He is the first of the Shereefs or descendants of Mohammed, who regard with contempt the claims of the Osmanli Emperor to the califate, and consider him and his loose-living subjects as little better than Infidels. With Turkey, Morocco has no diplomatic relations. This has always been the case, and now that the Shereef of Wazan, who, as another near descendant of the Prophet, and the head of the sect of Mulaï Taib, was at one time about as powerful as the Sultan, has become a French subject (and, it is whispered, drinks brandy and eats the accursed beast), though he and his English wife live apart, the Emir-al-Mumenin, the Prince of True Believers—as the ruler of Morocco styles himself—is more absolute than ever. His people may curse his tyranny, or the tyranny of his officials, and groan under the extortions to which they are subjected. Yet, let a European army land, and they would to a man, or a woman—for the women in some of the tribes follow their husbands to battle—fight for him and for the Faith. People who write so glibly of the French or of the Spaniards 'seizing' on Morocco know little of what they talk. After more than fifty years' occupation, Algeria, in spite of its costly roads and railways, and the sink it has been for French money, is still barely subjected to Frankish rule, though, when the pirates' strong-

hold was captured, the country was broken up among a number of rival princes, who mutually hated each other and the Turks, to whom the Dey and the Algiers janissaries belonged. But there are no railways and no roads except bridle-paths in Morocco, and no such internal dissensions as in Algeria. This the Spaniards discovered; for, though they easily defeated the undisciplined army of Sidi Mohammed—and since then the troops have been reorganised by English and French officers—they found it cheaper to take an indemnity than to occupy Tetuan; and to this day, in spite of their Presidios or posts on the Morocco coast, they maintain so precarious a footing, that the very sentries on the ramparts of these spots are liable to be popped at by the wild tribesmen's long flintlocks.

Something of this the visitor who crosses the Strait of Gibraltar soon learns for himself. He leaves a British fortress and a British town and in a few hours reaches one which, though for more than two centuries Portuguese, for twenty-two years English, and still more tinctured by European ways than any other in Morocco, is far more Moorish than Algiers, or Tunis, or Constantine. But the voyager in that brief run passes not only from one quarter of the world to another, from Europe to Africa; he jumps at a bound into the middle ages, into a state of society which he must, in any other part of the world so near the centres of civilisation, merely imagine. He could not see it. For before him lies a walled town, with houses like huge cubes of chalk tumbled down on the slope, crowned by a few green-blinded villas, the homes of 'those who fear not Allah.' This is Tangier—'the City preserved of the Lord.' The shadow of Europe, it is true, has fallen upon it. Beside the square-towered mosques with the little flags which indicate the hour of prayer, there rise hotels for the accommodation of the Infidel; and outside the walls there has been erected of late years a little English church in corrugated zinc—that transition stage of architecture, which all the world over marks a purse above wood, but unequal to stone. The Nazarene—the Rumi or Romans, as the natives, with a persistent memory of their old conquerors, still call them—are here in abundance, though for the most part Spaniards, either born in the place or from Gibraltar, where they are known by the lordly Britons as 'Rock Scorpions.' And here the foreign representatives reside, though the nearest of the three capitals is seven days' ride in the interior. But the Moor is master. In his narrow lane-like street he bears himself like one, and is inclined to yield not one footbreadth of the road to any wandering Unbeliever. On each side of the squalid way are shops like packing-boxes, on the floor of which sits the owner, within easy reach of his wares, while the customer stands on the street bargaining after the weary fashion of the East, the merchant asking twice what he intends to take, the buyer

offering half what he intends to give. Horses and donkeys struggle with the pedestrian for a footing. 'Arra! Arra!' is heard on every side; 'Balak!'—by your leave—is about the first word of Arabic which the new arrival hears, until he passes through the landward gate, or is in the 'Sok' amid a wild concourse of men and beasts.

For it is market-day, and a more picturesque scene it is hard to conceive. We have reached a land in which there are no wheeled carriages, yet the babel of voices furnishes din enough. Amid the dense mass of buyers and sellers, among oxen and sheep, donkeys and camels and horses, we thread our way, stopping ever and anon to watch the unwonted sights around us. Here are two Arabs, all turbaned and 'jellab'-ed and yellow slippered, shrieking and clutching their turbans and invoking their beards and the beard of the Prophet. Another moment, and it seems certain that the curved daggers hanging at their belts will be out. But no; they are only disputing in a friendly way over a coin of which it takes fifty to make fourpence; and the difference settled, the bullion under discussion is transferred to the leather pouch which is invariably slung over the shoulder of every labouring Moor. It is at once his pocket, his purse, and his haversack. A troop of weary camels have arrived it may be from Fez, or from Taflet, on the other side of the Atlas, laden with merchandise from the far-away Soudan, and from their appearance, seem to have had a hard journey, long delayed by the swollen rivers which had to be crossed, and the flooded country over which they had to pass. The tents of some Bedouins are pitched near at hand, their owners, long flintlock on shoulder, glaring defiantly at the Nazarenes, while the Rifian pirates—and they are still at times addicted to the old traits—curse loudly the Christian consul whose *carass* orders them to give way. In a corner, an eager crowd is listening to a glib story-teller, wand in hand, who prattles of Sal-a-din and Al-Manzur, and many a tale which is familiar enough to the reader of the *Arabian Nights*, with some which the folklorist might do well to garner, while in and around and over all is that peculiar odour of argan oil and charcoal fire which is characteristic of a Moorish market-place. Beggars abound. Some are holy men, with axe and cup and the green turban which proclaim them Sher-eefs or descendants of Mohammed; and villainous scoundrels most of them are. Others are simply mendicants, who find a profit out of the all-abounding charity of the Moslem, even though, like the gigantic negro, with a voice that resounds over the market as he calls for alms in the name of 'God the great,' they may have been robbers deprived of their eyes as a punishment for offences many and manifold. Snake-charmers from Sus are here also. Minstrels abound; and it may be one of the wild fanatical sects of the South, such as the 'Eisouias,' scatter the crowd on either side. A Jewish wedding; an Arab bride carried home in the curious box fastened on a horse's back; or the procession which accompanies the boy who has read the Koran, or completed the ceremony which stamps him for ever as a son of Islam, lend a gayer aspect to the scene.

And whatever may be the morals of the people, it is certain that externally at least Morocco

is the most religious country on the earth. Every act, almost every expression used, is tinged with allusions to the Faith. 'In'shallah' and 'Bismallah'—'If the Lord wills,' and 'In the name of the Lord'—are every minute in the mouth of the rudest peasant. Indeed, the readier he is to cheat you, the more volubly does he invoke the name of the Most High, so that one can well believe the tale of the Gibraltar Jew whose price was twenty-five per cent. higher when his Moorish customers promised to pay 'three months hence—Inshallah'; for 'If the Lord wills' means too frequently, 'If I cannot avoid payment altogether.' The very costermonger recommends his wares by pledging the credit of a saint: 'In the name of Mulai Idriss! Roast chestnuts!' 'In the name of our Lord Mohammed Al Hadj! Popcorn! Popcorn!' 'In the name of Sidna Ali-bu-Rhaleh! Melons! Nice sweet melons!' 'God is gracious! Beans! Fried beans!' 'There be no might nor majesty save in Allah! Water! Cool water!' These and the like are heard at every turn. Even the auctioneer who is calling out the price of a slave-girl, or the bids for a Rabat carpet, is careful to interlard his professional talk freely with allusions to His Maker and the plethoric roll of Moorish saints.

An hour later we are sitting at dinner. Through the open window come the distant hum of the market—the shouts of the donkey-drivers returning home, the groans of the overlaid camels, the reports of muskets—of men trying new ones, or of marksmen firing, Tell-like, at oranges held in a friend's hand—the shrill reed-pipes of the wandering musicians, or, it may be, the fusillade of a troop of white-robed cavalry engaged in the favourite Moorish game of 'powder-play.' The Major who has run across from 'Gib.' to have a day with the snipe is inveighing on the wrongs of Irish landlords and the mischiefs of the short-service system, when suddenly there is a silence, and then from every mosque tower comes the long-drawn cry of the muezzin calling to prayer. For a few minutes the din is hushed, and anon the noise and shouts and musket-fire begin afresh. Then darkness falls and the gates are shut; the packing-box-like bazaars are closed with rude padlocks, and every one goes home for the night. The narrow streets are left in darkness, and deserted save for a few curriah dogs, and the frowsy multitudes which not long ago were crowding the 'Sok' are now miles away in reed-thatched villages, the cactus hedges around which are gay with blossoms in summer and laden with prickly-pear in autumn.

This is Tangier, the most Europeanised of all the towns of Morocco; and the coast-lying places all resemble it more or less. None of them of any consequence, except perhaps Salée and Azimur, are altogether without Europeans, though in most of them the number is limited to a few families. But though they all bear the impress either of later European influence, or of the time when they were, for the most part, occupied by the Portuguese and Spaniards, the native squalor is out of all proportion to the foreign civilisation. All are crumbling, and all of them dreadfully dirty. Sanitation, except when the European residents undertake to dig the accumulated filth of ages out of the narrow lanes, is unknown. Everything is primitive in the extreme, from the barges

into which the cargo is discharged out of the ships lying in the open bays, to the captain of the port, who intermits his professional occupation of cursing the turbaned barges to pray on the beach when the mosque flag flies. So with the Custom-house officer sitting cross-legged in the shed hard by, and the Bashaw of the city, who administers a kind of corrupt justice according to the Koran under a white-washed archway at the corner.

But it is only when the traveller penetrates the interior that he finds how very stationary is the land of which he has hitherto only seen the outside. He must ride at a walking pace with at least two soldiers, as representing the authority of the Sultan, or take the consequences of the country-folk mistaking his intentions. And he must take with him tents and baggage animals and riding-beasts, a cook, and the wherewithal for him to cook. For we are entering a land in which no man's roof will shelter the Infidel; in which there are no Europeans; where nothing save eggs and fowls can be relied upon as food supplies; where there are no hotels save the caravanserais, where the cattle and their owner are accommodated in the same enclosure; and, above all, where the only roads are in the shape of bridle-paths worn by the trampling of yellow-slipped feet, and endless droves of horses and donkeys, and mules and camels, and goats and sheep and cattle, throughout unnumbered ages. It is rare to find a bridge, and the chances are that the ferry must be crossed on a raft of reeds, while the animals are swum and reloaded on the other side. Possibly, if there is a sudden fall of rain, the traveller may have to wait between two rivers days before the water falls low enough for him to ford. If the period chosen for the journey is autumn, the country is bare and burnt up. It is 'Brown Barbary' indeed. All the landscape is of a tawny hue, and wells and streams alike are of scanty dimensions. But in spring the land is bright with verdure and gay with flowers. Every valley is waving with crops of wheat and maize and barley; or the owner is cutting his corn with his dagger, his firelock within easy reach; and the flocks of the roaming tribesmen are pasturing for miles around their acacia-hedged camel-hair tents. Little in the scene suggests Africa. There is no desert; but plenty of oranges and lemons, and grapes and pomegranates, and, except in the South, palms of any sort are rare.

The country in Northern Morocco is for the most part rolling hills, capped with a patch of trees around some saint's white-washed tomb, or covered with thickets of palmetto, out of which coveys of red-legged partridges flutter or wild boars rush snorting. The plains along the river brink are often far-stretching, and as fertile as the American prairies. But cultivation is small, out of all proportion to the population, and the population is so scanty that even in the course of a day's journey only a few people will be met. These are mostly country-folk, laden with provisions for the market, or driving camels and donkeys before them, or soldiers on the Sultan's business, or it may be travellers like ourselves on their way to the coast or to some other town. The city ladies are all veiled. But the country-women take no such precaution except when in towns. Nobody, it must be admitted, is over-genial,

though open incivility is rare. Possibly a waspish old woman will turn to the wall as we pass through a town, or a young one—if the men-folks are about—will speak disrespectfully of our burnt father, who, like ourselves, 'will never see Paradise;' or a laughing-faced country lass trudging to the fair with her red shawl round her neck may, as a saucy repartee to the badinage of our soldiers, inform them that the fire is lit for them and their Nazarene train. At worst, they sulk past, muttering unpleasantnesses, or return our 'Salaam Alikum' (Peace be with you) with the saving clause, 'to those whom God hath given peace'—that is to say, to the 'True Believers' only. Every night we must encamp in some village, the sheik of which is made responsible for our safety, though, after we have left, the good old man will, as likely as not, burn green boughs on the spot where our tents were pitched, in order to purify the sacred soil of Islam from the taint left by such Infidels.

A village may now and then be seen—though, to avoid the extortion of the imperial officials, the villages are usually off the routes of travel—or a half-ruined town encountered. If we desire to halt in one of these, say in Fez or in Marrakesch, we must produce a letter from our consul in Tangier or in Mogador, for there are no consuls or ministers off the coast; and after the governor has granted permission, a place to stay in will be allotted us, the conveniences and the locality of which being carefully apportioned to the supposed rank our letter may indicate. Yet at best we are early made aware that our absence will be excellent company, though every morning, if our credentials merit their attention, a 'mouna' of provisions will be sent us in the Bashaw's, or even in the Sultan's name.

The latter, however, is most likely marching about the country collecting the taxes of refractory tribes; and even if not, unless when he goes to the mosque, it is difficult for any one not an Envoy to have an audience of Mulai el Hassan. He speaks no language except Arabic, and his ministers, mere creatures of the hour, are equally ignorant. They want no change, and they know well that any change must sweep away them and their system of tyranny and extortion. No man is paid more than a nominal salary. He buys his office; and in the course of a few years, if peradventure he is not squeezed dry by the Sultan before he has time to grow rich, recoups himself by all manner of peculation and plunder. The prisons are full of their victims; and no man desires to appear wealthy lest he should tempt these official horse-leeches to bleed him. A few cattle are permitted to be exported to Gibraltar under a special treaty; and wheat has within the last few months been allowed to be sent out of the country, though under conditions which render the concession almost valueless. But no four-footed beast can be exported without the Sultan's permit. Hence, a land which might support fifty millions of people in comfort does not contain a tenth of the number. The mineral deposits—silver, iron, antimony, manganese, gold—are rich, but undeveloped, and every effort to induce the Sultan to open them has been refused, for this would give the Europeans a foothold, and increase the number of those 'protected subjects' which have ever been a source of just irritation

to him. For Morocco, there is, we fear, no future under the present *régime*, and those who know the country best leave it convinced that without a European war—which all Africa is not worth—there can be no improvement from without. Lord Salisbury has hinted more plainly than at any former date that, as far as Mulai el Hassan is concerned, the sands have nearly run out. But what does this mean? Nothing, except that the Premier's words have by this time been translated into Arabic, and sent to the Sultan as a proof that if Codlin's not the friend, neither is Short. And the Sultan will continue to wag his beard in the gardens of Fez or Mequinez or Marrakesch—fair within, squalid without—well aware that the mutual jealousies of the 'Christians' are the best protection of the land which the Arabs describe as Moghreb-al-Aksa—the Farthest West—and other people as the China of Africa. For Tangier is the Pumpernickel of modern diplomacy. What one Envoy proposes, another opposes. Meantime, Morocco is 'l'Empire qui croule.' But the crumbling has taken a long time. Twelve centuries have left it not much worse than it began—something feebler, not so rich, but assuredly no liker Europe than of old.

A SOLDIER AND A GENTLEMAN.*

CHAPTER IV.—DOLLY.

THE genial Mr Drew, the wealthy banker, entertained very splendidly. The ballroom of the evening was a lofty marquee on the lawn of the little garden of his house. It was hung with blush-rose silk, and floored compactly with polished oak, and thereafter adorned with ample cool green shrubs, between which were set silk and velvet lounges; and it was illumined with electric lamps enclosed in Chinese lanterns, which subdued the light to a pleasant tone, so that the palest and most weary guests looked fresh and blooming.

Ferrers stood with Lord Debrett by one of the exits into the garden. They had arrived early, Ferrers pleading for that arrangement so that he might 'find his feet,' as he said, before the crowd of people came. Sir William was coming, but he was not yet come.

'I'm rather afraid of this, you know,' said Ferrers. 'I wish I hadn't come. I don't feel at home in these togs. I feel as if I looked like a waiter or a fool. If I were a little chap, I wouldn't mind; I wouldn't be noticed.'

'Oh, there's nothing to be scared about,' said Lord Debrett. 'You'll be all right.'

'Now tell me truly,' said Ferrers—'don't I look an awkward beggar?'

'You look first chop,' said Lord Debrett promptly.—'Come and have a glass of champagne; that'll steady your nerves.'

They went to the buffet in the supper-room.

'You've got to dance, you know,' said Lord Debrett.

[* Copyright reserved in the United States of America.]

'Sir William,' said Ferrers, 'seemed to think that after all I'd better not. He particularly wants me not to dance with Miss Dawlish.'

'Miss Dawlish? What Miss Dawlish? Not his old sister?'

'I suppose not,' said Ferrers; 'but I don't know. He's a close old joker.'

'He is,' said Debrett. 'I don't know what his game is at all. But if there's another Miss Dawlish—a young un—it may be about her. Don't you remember he said it concerned a lady? I never heard he had a daughter, though.'

'Maybe his banker brother left a daughter,' suggested Ferrers.

'That must be it!' exclaimed Lord Debrett. 'But at any rate you dance. You'd like a spin with a nice girl, wouldn't you?'

'I would,' said Ferrers at once; his self-confidence was rapidly returning under the stimulus of the generous, foaming liquor he drank.

'Very well,' said Lord Debrett. 'Let's go down.'

As they left the room, Ferrers saw two tall, distinguished gentlemen of about the same height and the same handsomeness of figure—both set off by their well-fitting evening dress—come straight towards them. He had taken a step to stand aside in order to let them pass, when he stood stock still. 'By Jingo!' he exclaimed. It was himself and Lord Debrett reflected in a tall glass near the door! He curled his moustaches and passed on, well satisfied with his appearance.

He had barely returned into the ballroom—where there was now a considerable throng—when he was met by Mrs Drew, a comfortable City lady with a Roman nose, to whom he had been introduced on his arrival.

'I've been looking for you, you naughty man,' said she. 'I want to introduce you to your cousin Dolly.'

He was led without any objection on his part towards a young lady who stood fanning herself and talking with a gentleman. She turned as they approached and awaited their coming with an evidently lively interest. She was not tall—she would stand no higher than Ferrers' chest—but she was plump, comely, and bright-eyed. Mrs Drew introduced them.

'Now I'll leave you,' said she. 'It must be a great many years since you two have met, and you must have a great deal to say to each other—and you must dance.'

Ferrers had nothing whatever to say, and Dolly did not help him, for she was shy. But he had sufficient presence of mind to be aware that under these circumstances the best thing was to ask her to dance.

'They have just begun a waltz,' said he. 'You are not engaged for it?'

'No,' said she.

'May I?'—he asked.

She took his arm; they stepped out; and away they went. Ferrers thought her most sweet and adorable. As they swung round easily in time

with the music, in the close contact of the waltz, Ferrers' awkwardness vanished, and he began to talk.

'It must be a great many years since we met,' said he, making a brave dash at a leading question.

'Oh yes,' said she. 'I don't think we've met since I was a little girl and you were a big boy just done with school.—You hadn't much of a moustache then,' she continued, glancing up at him.

'No,' said he; 'but I daresay I shaved hard to get one.'

'And you must have stretched hard, too, to grow tall,' said she, with a merry little laugh. 'I never expected to find you so big.'

'Oh,' said he, 'I hope I'm not too big. Shall I try to grow smaller? I've been afraid for a long time there was too much of me.'

'Don't be foolish,' said she. 'Of course you're not too big.'

'If you don't think me too big, I don't care,' said he, and he tingled throughout his frame with the thought of having uttered something delicious and daring.

She blushed a little, and was silent; and he was silent too.

Presently the waltz came to an end, Ferrers feeling he had not had nearly enough of it, and forgetting, in Dolly's charming company, Sir William's request that he would not dance with Miss Dawlish.

'Don't you think,' he asked, 'that we might have another dance together?'

'I don't know,' said she, as he led her to a seat. 'Not the next one, at anyrate. That might seem too noticeable, even though we are cousins.'

'Oh, yes,' said he; 'the next one, please.'

'Why?' she asked; and there was the flush of health on her cheek and the sparkle of challenge in her eye.

'Why?' said he. 'Don't you guess that I should like to be with you as long as possible?'

She said nothing, but she blushed divinely; and soon another dance—a waltz again—was struck up.

'I'm glad it's a waltz,' said he, as they swung away in the sensuous, intoxicating motion: 'it lets you talk without bothering your head about all kinds of figures and turns and twists.'

'I suppose,' said she, with apparent irrelevance, 'when boys grow up to be men they always improve?'

'They ought to,' said he. 'But why do you say that?'

'Because I think you are so much nicer than you used to be.'

'Am I?' said he, with a certain sense of triumph over his other, his former self, the real William Dawlish.

'You don't remember, I daresay,' said she, 'what a spoiled, sulky boy you were; how, whenever I was down at Dawlish Place, you used to tease me and my dog, and not let me look at the treasures of pipes and things you kept in a box?—'

'What?' said Ferrers, unconsciously identifying himself with the person spoken of. 'Did I smoke then?'

'Oh yes. Don't you remember that? You

even smoked nasty tobacco with the horrid stable-boy and the gardener's boy.'

'What a disagreeable fellow!' exclaimed Ferrers with feeling.

'Well,' said she, with a woman's tender talent for excuse of those she is interested in, 'seventeen is a disagreeable age. It is eight years since then'—

'I'm twenty-five, am I?' thought he, with a troublesome consciousness that he was five years more than that.

'And you have seen and done a great many things, and suffered many things, too—haven't you?'

'Yes; I suppose I have.'

'I daresay,' said she, with a half-shy, half-defiant glance up at him, 'I was not nice then, either.'

'I am sure,' said he, 'you were always nice.'

'I don't believe you remember,' said she, with a laugh, 'whether I was or not!'

He was prevented from replying by the sudden qualm of concern which seized him on noting, as they whirled round, that Sir William had arrived and was regarding him with no very pleasant aspect, while he bent over a shrivelled duenna with a curious glittering head-dress!

'Who is that,' he asked of Dolly, 'that Sir William is talking to? I can't see very well.'

'Why, don't you know? That's Aunt Dawlish. Have you forgotten her?'

'Bless me!' he exclaimed. 'Is that Aunt Dawlish?'

'And why,' she asked, 'do you call your father "Sir William"?'

'He is Sir William?'

'Of course; but it sounds odd for you to call him that.'

'I suppose it does. I've got into the way of it without thinking.'

He was glad that at that moment she proposed to slip from the whirl of waltzers to cool herself in the outer air of the garden. He marked, ere they went, where Sir William stood—talking about him, he was convinced, by the look he had noted—and then, when they were out, he led her towards the spot which he had marked with his eye. He found a garden chair for her, while he himself leaned against one of the slim poles of the marquee. His experience of camp-life had taught him how to overhear a conversation within a tent. With his pocket-knife he made a slit in the canvas wall and leaned his ear into it. His chance cut was a good one. He found he was immediately against Sir William's shoulder.

'The young man,' said Sir William, 'will give no trouble; he's as docile as a dog—though I did tell him not to dance with Dolly. When this is settled, I'll give him his *congé*, and he'll never know what he was used for.'

'I hope he's as simple as you think him,' said the lady. 'He doesn't look to me as if he were.'

('And he isn't, ma'am!' thought Ferrers.)

'But at anyrate,' continued the lady, 'I can have nothing to say to him.'

'But you must,' declared Sir William with energy. 'Listen to me.'

And Ferrers heard no more.

'I hear you have only just arrived from abroad,' said Dolly; 'but I suppose you know we are going down to Dawlish Place next week?'

'Yes,' said he; 'I've heard of it.' ('But only this minute,' he thought.)

'You'll be there, won't you?'

'Oh yes; I expect I shall be there.'

Whether, because she thought him becoming dull and unresponsive, or because it was time—the music and the dance ceasing at that moment—Dolly said she wished to go in. Ferrers gave her his arm.

'Take me to Aunt Dawlish,' said she.

But as they approached Aunt Dawlish, that lady rose with a great commotion of the glittering and dangling ornaments of her head-dress and fluttered away. Dolly incontinently left Ferrers' arm and hurried after her, saying: 'What's the matter, aunt?' Ferrers turned and looked at Sir William, who was lowering and showing his teeth.

'I asked you,' said Sir William, 'not to dance with Miss Dawlish.'

'I couldn't help it,' said Ferrers. 'Mrs Drew introduced us.'

Sir William nodded once or twice half-absently, and then moved away after the ladies without another word. Ferrers was hurt and angry. He turned and marched out into the garden. He sat down in the chair Dolly had occupied and chewed his moustache. Presently his attention was seized by some desultory talk he overheard. Two or three young men stood a little way off smoking cigarettes.

'They tell me,' said one, 'that was young Dawlish—that whacking six-footer—dancing with his cousin Dolly.'

'Nonsense,' said another—'not Sir Billy's rip of a son! He used to look like a long monkey up a stick!'

'Fact, though,' said the first. 'He's been away somewhere for years—exploring Central Asia or Central Africa or Central America'—

'Central something, I'll be bound,' laughed the other. 'And he's lost all his monkeyness.'

'It'll take me a long time to get used to the idea that that big chap is the Will Dawlish I once knew,' said the other. 'I always thought he'd gone cracked—wrong in his upper story, you know.'

'Tom,' said a third, 'you always get hold of the wrong end of a thing. Even at school, you were always getting your book upside down, and taking hold of your private frying-pan by anything but the handle. He went wrong, but not in the head. What's the confounded rhyme? You know—"In consequence of which he was ruined totally, and married a lady in the *corps de ballet*."'

'Oh, that's it, is it?' thought Ferrers. 'If there's a real William Dawlish in existence, he is married already, it appears.'

And he rose and slipped away. He entered the marquee, but he did not linger there. He passed through it into the supper-room and went to the buffet. While standing there, he turned and saw a black-muzzled man, not in evening dress—the very man he had dropped the evening before into the basin in Trafalgar Square—curiously regarding him! He wondered, with a sudden quickening of alarm, if he were now to be found out. Had he, when he talked to the man, betrayed that he had been a private soldier? He could not remember,

though he did not think he had. In any case, he thought it prudent to withdraw. And so, without stopping to consider whether it was 'good form' or not, he got his hat and coat and left the house.

THE COLOURS OF THE STARS.

THAT must be a very careless-minded and unservant person who, when crossing an open heath on a bright starlight night, does not linger a while to gaze at, perhaps to guess at, the innumerable luminous points glistening throughout the sky in this small patch of boundless space which we are apt to call the universe. Some, he will note, as in the Milky Way, are like shining dust sown broadcast along certain tracts of the heavens; others, gradually increasing in visible magnitude and distinctness, assume the aspect of individual and independent centres of light and—who can doubt it?—of heat. He will involuntarily murmur to himself Mrs Barbauld's lines:

Twinkle, twinkle, little star!
How I wonder what you are,
Up above the world so high,
Like a diamond in the sky!

The problem of 'What you are' has, with other branches of physical science, made considerable advances towards solution. To those who complain that we still know so little about natural phenomena, it may be replied that the wonder is that we know so much; and above all, that what we do know, we know as surely and certainly as we can predict that an apple, detached by a gale of wind from the branch on which it hangs, will inevitably fall to the ground.

An ordinary observer, blessed with healthy sight, and not afflicted with colour-blindness, like those unfortunates who cannot distinguish the red of a cherry from the green of the leaves amidst which it has ripened, will soon perceive that every star does not shine with exactly the same hue or tint of light. Some, like the Dog Star, send forth rays of most brilliant white—veritable diamonds in the sky; others are decidedly red; others, again, beam delicate shades of blue or lilac. These diversities of colour amongst the stars are more conspicuous and striking in tropical skies than in our own misty latitudes.

The planets are not in question here; but even they differ in colour. Mars presents a ruddy disc, attributed by some to the reflection of the sun's rays from a red sandstone or a red-clay surface; by others, from a red-leaved vegetation, like our own purple or crimson varieties of cabbage, coleus, and orache—the last, though a kitchen herb, being often grown for ornamental purposes. Jupiter, the giant planet, the most brilliant after Venus, is brightly white, although it has been doubted whether we see, not its actual surface itself, but the bands of cloudy vapour in which it is enveloped. The colour of the disc, however, is variable, with changes in the hue of certain portions almost from day to day. Saturn, to the naked eye, appears as a star of the first magnitude, but much less bright than Jupiter, Mars, Venus, and Mercury, and of a slightly leaden tint. This sombre hue, together with the

slowness of its movement round the sun—twenty-nine years, five months, and sixteen days—induced the ancients to regard it as an unlucky star, exerting an evil influence on human affairs. Of Saturn's three rings, the middle one is always brighter than the planet itself. His satellites have been observed to vary in their respective brightness, as if they always turned the same face to the planet, exactly as the moon always turns the same face to the earth. The first three satellites are all nearer to Saturn than the moon is to the earth, and would be still nearer if their distance was measured from the surface instead of the centre of the planet.

Many stars which appear single to the unassisted eye are found, when viewed through a good telescope, to be double, triple, and even multiple; that is, they are associated suns, in most cases revolving round each other at varying distances, and each no doubt attended by its own system of planets and their satellites. The double and the multiple stars often present great varieties as well as contrasts of colour. Some require higher powers of the telescope than others to show that they are separate. Instead of being white, they often shine with differently coloured lights; the emerald is coupled with the ruby, the topaz with the sapphire, the opal with the amethyst. Sometimes these marvellous stars remain apparently fixed and immovable. Long years of observation have discovered no change in their relative positions. Sometimes, on the contrary, the associated stars gravitate one round the other, the smaller round the more massive, like the moon round the earth and the earth round the sun, with periods varying from only a few years to several centuries.

M. Camille Flammarion informs us that a great number of systems consist of two suns of equal magnitude. The majority are white or yellow; but one hundred and thirty are known whose two suns are differently coloured, and amongst them eighty-five where the contrast is remarkable, the principal sun being orange, and the second green or blue. He also gives a short list of the most beautifully coloured double stars, which, as maps of the stars are now so good and so inexpensive, must be useful to those who wish to find them.

In his admirably copious volume, *Les Étoiles et les Curiosités du Ciel*, he directs attention to a very extraordinary star in the neighbourhood of the North Pole, namely μ of Cepheus. The Greek letters are used to indicate the stars in a constellation. Look for it near α . William Herschel called it Garnet Sidus (the Garnet Star), and such, in fact, its colour is. Sometimes it is as red as a garnet illuminated by electric light, and sometimes it shines with a vivid translucent orange tint. It is the reddest star visible by the naked eye; the telescope shows stars which are completely blood-red. To appreciate its remarkable hue, one ought first to look at a white star, such as α of Cepheus.

From the redness of this star and the quality of its light as examined by spectral analysis, M. Flammarion concludes that it is undoubtedly a case of a fast-declining star in the final stage of its existence as a sun. When we behold this ruddy star faintly glimmering in the neighbourhood of the Pole Star, we may safely regard it

as heralding extinction to all that depends on the warmth of its beams.

The *Annuaire of the Bureau des Longitudes* for 1888 publishes an interesting 'Notice Scientifique,' by M. Janssen, on the Age of the Stars. The stars being suns analogous to our own, he maintains that they are subject to laws of evolution, resulting for them in a beginning, a period of activity, a decline, and an end. The stars are formed of nebular matter, which, condensed, gave birth to suns and to the planetary bodies which form their retinue. White or bluish light, like that of the Dog Star, is emitted by suns in full possession of their highest energy. After Sirius, we have Vega, belonging to the constellation of the Lyre, a white star, seen in summer in the zenithal regions of our sky. It is admitted that the mass of this sun has risen to a very high temperature, and that it has before it long periods of activity and undiminished radiation.

Another class of stars betrays, by spectral analysis, a more advanced degree of condensation. Though still powerful, they have passed what may be called their youth. To this class our own sun belongs. Remarkable fact: in general the colour of these stars corresponds to their constitution. It has no longer the splendour, the whiteness which characterise stars belonging to the first class. Some are yellow, and even orange.

But there are stars still more advanced in their sidereal evolution. Their spectrum shows signs of fatal cooling. The colour of such stars answers to the other conditions which are admitted as signs of their decrepitude. It has turned to deep orange, often passing to sombre red.

The colour of the stars has thus been taken to indicate the age of those heavenly bodies. Another astronomer, M. A. Cornu, has endeavoured, from the colours of the stars, to trace their motions; for stars are no longer supposed to be fixed; fixed stars are obsolete. Now, if a star is moving across our visual line—that is, across the straight line drawn from our eye to the star itself—either perpendicularly or transversely—the direction of its motion will be observable, although perhaps with difficulty, on account of the apparent minuteness of the measurable distance. But if the star is moving directly along our line of vision—that is, advancing directly towards us or receding from us—its motion will be hard to ascertain by the above-mentioned means of measurement.

M. Cornu proposed to solve the problem by the colour of the star and the spectral analysis of its light. He investigated the influence of the relative movement of a sonorous or a luminous body on the sound or the light heard or seen by a stationary observer. Both sound and light are produced and conveyed by waves or pulsations. But suppose the observer to be in motion, retreating, for instance, away from the source of sound or light, that is, travelling in the same direction as the propagation of the pulsations or waves; such an observer will receive, in a unity of time, fewer pulsations than the source emits, because he is moving in the same direction as the undulations. He would not receive any if he were moving with the same velocity as theirs. Consequently, an observer, travelling away from a

sonorous source, will hear a lower sound than that actually given out by the source itself; for the scale of sounds, from high to low, is characterised by the diminished number of vibrations in a given unity of time. In the case of a source of white light, the observer will behold a redder light, because the gamut of spectral colours, from violet to red, corresponds to the gamut of sounds from high to low.

Inversely, if the observer travels towards the source, that is, in a direction to meet the emitted waves, the number of pulsations received in a given unity of time will be greater; the sounds will therefore appear sharper or the white light more violet.

The source of vibration has been supposed in this statement to be stationary and the observer in motion; but the same reasoning would lead to analogous conclusions if the source were in motion, receding from or approaching an observer in repose; from which it evidently results that it is the relative movement alone which plays the decisive part, allowing us, to simplify the argument, to suppose the observer fixed and the source in motion.

Some of the conclusions (Doppler's, quoted by M. Cornu) are these: By the approach of a luminous object, the intensity of its light is continuously increasing. With an increasing velocity, its coloration passes from white to green, then to blue, and finally to violet. If the velocity of a star happens to change, its colour as well as its intensity suffers variation; and it may well be that in the lapse of time a star may assume all the colours of the spectrum.

Stars, then, it is clear, have ceased to be fixed. Our own sun, planets, moons, and all, are fast rushing, we are told, in the direction of the constellation Hercules, where a well-known prodigious agglomeration of stars is to be found. We shall probably never get a nearer view of them, as Hercules will be on his travels too. But no matter whither we are going, provided we do not jostle by the way, an accident we need hardly apprehend, there being plenty of room for us in any direction.

THE TROUBLE AT GREAT BUCEPHALUS.

CHAPTER II.

THE sun had so nearly sunk below the horizon that its rays barely touched the tops of a range of low hills which line the edge of the vast prairie which runs northward and eastward from Great Bucephalus, leaving the intermediate hollows in a shade which would soon be the darkness of night, when a group of residents of the city, who were looking in that direction, saw a string of wagons turn the angle of the hills and come directly towards their important 'location.'

'Five teams!' said one of the lookers-on; 'and all passenger teams, you bet! Where on earth can they be going? To Strapley's Mills, I should say, or?—'

'They are coming here!' exclaimed another, a tall, stalwart, young fellow. 'They would have avoided our slope if they had been going to the Mills.—Don't you think so, Mr Eltran?'

'I do think so,' replied Eltran, who had been

among the observers. 'But what they want here I cannot guess. They surely cannot be troops. I only hope they may be.'

'Troops! I should think not!' said the first speaker. 'No one ever saw troops travel in such— Why, darn me! there's a woman in the first wagon.'

'There is indeed,' assented the young man. 'They must have crossed the Broken Prairie and come through Little Fox Hills.' He said this with something in his tone which was almost awe.

This was echoed by the first speaker, who said: 'A woman must have real grit who could cross the plains now, and come through hills where the Apaches swarm like prairie dogs.'

'True. But perhaps they are strangers in the territory, and did not know their danger,' continued the young man; 'so they— Why, she sees us, and is making signals to us. She is waving a handkerchief. And there is another woman, and she is waving a handkerchief too. I will answer them.' With this the young fellow took a scarf from his neck, and in the next instant would doubtless have carried out his intention, but Eltran placed his hand on his arm and said: 'No; do not, Phil. I think they are coming to me.'

The young man turned in some surprise to the speaker, whose voice was a little huskier than before, while he looked much concerned.

'I think they are friends of mine,' he continued. 'I hope not; but I think it is so.—Let us go down and meet them.'

In accordance with this suggestion, the trio walked down the long slope, which the teams were ascending at a very slow pace; for there were no made roads around Great Bucephalus city, and it was well to spare the mules. A few other 'citizens' had also been watching the approaching teams, but did not take sufficient interest in their approach to induce them to go towards them.

There was no mistake as to there being women in the first wagon, or as to their making signals; and as these were redoubled when Eltran raised his hat, he was clearly right in his conjecture that the party were his friends. On the wagon halting at some impediment, a young man leapt from his seat, and with a hearty shout of recognition, ran over the space between him and the three citizens. On reaching them, he grasped the hand of Eltran and wrung it heartily. 'We have come, old fellow!' he cried. 'We said we would, and here we are. Polly with the two children and Aggy are in the wagon.—Are these gentlemen my new neighbours?'

'Yes,' returned Eltran; but his speech was hesitating, almost faltering, with nothing of the hearty ring with which the new arrival had spoken. 'This is Mr Philip Trayle, a farmer in the vicinity; and this gentleman is Mr Abel Martleton, store-keeper—our principal store-keeper.'

The new-comer shook hands with the citizens, and then said hurriedly, for the wagons had now moved on, and were coming up: 'My old friend has omitted to tell you who I am. I am John—more often Jack Boytell, from London, a genuine Cockney—I hope you know what a Cockney is?—and therefore exactly qualified to seek and make

my fortune in the Far West, which is precisely what I have come to do.' He laughed cheerfully again as he said this, and indeed seemed a hearty, frank, young fellow enough.

The citizens shook hands again after this announcement, and he who had been called Martleton responded. 'We were in the positions our friend Eltran has mentioned,' he said; 'but we have concluded to clear out; and to-morrow, or on the next day at farthest, we shall make tracks.'

'What! Do you mean?'—began Boytell.

But the wagons now drew up alongside; and Eltran, in reply to a shrill cry of delight from the women and children, sprang to the first one, his countenance brightening for the moment; hitherto, it had presented a marked contrast to the genial expression of the face of his friend Boytell.

Two women and two children were helped from the vehicle, all of whom Eltran kissed and warmly welcomed. Several packages were 'unshipped'—so they called it there—from the vehicles, and then the cavalcade moved on towards the open prairie, not climbing the remainder of the ascent to Great Bucephalus city, which certainly was rather steep on that side, and might have been avoided on that account; but it was assuredly not in reference to the slope that a man who seemed to be the leader of the expedition spoke in conclusion to a brief conversation he had held with the two citizens while Eltran was engrossed with his relatives, and the leader spoke in a low hurried undertone.

'I know that, strangers,' he said in reply to a remark made by Mr Trayle as to the impolicy of pushing on with the tired mules; 'but we shall reach Strapley's Mills in two or three hours. It is a good road, and a safe place, I hear, to rest at. I would sooner go on quite a piece farther than stay any time at Great Bucephalus. Yes; that is so.' He smacked his horse-whip as he ended his speech; and the mules moving on, soon drew the wagons to the open prairie, across which the teams journeyed at no great pace, for, good as the driver had declared the road to be, it was, after all, only the rough natural prairie.

Meanwhile, a small wagon had been brought down, and the luggage having been placed thereon, and one or two fresh introductions having taken place, the whole party ascended the slope to the city.

'And is this Great Bucephalus City, of which you wrote so much?' exclaimed Mr Boytell. 'Why, where are the streets, and the houses, and the people?' He spoke to Eltran and Trayle, the latter being the citizen who had brought the wagon; and Eltran, instead of replying directly to this question, said, turning to Boytell: 'Did you not get the letter I sent to Macdiggen & Co. at New York? I understood you were to call there.'

'Letter! No,' returned the other. 'And what is more, we did not go to New York at all; we came by Boston.'

Eltran uttered an exclamation of surprise, which sounded not unlike a groan.

'But what was your letter about?' continued Boytell. 'Was it of consequence?'

'No. At least it does not matter now,' was Eltran's answer, and the tone in which it was

spoken was so cheerless that Mr Jack Boytell stared in some surprise at the speaker, who, seeing this, made a strong effort to rally himself, and at once breaking into a hearty or, at anyrate, a loud laugh, turned to his sisters and the children and uttered a little jest on their rosy appearance.

The success of this digression was but momentary, as the first sentence spoken by his unmarried sister, Agatha, showed too plainly. 'Which is your house, George; and which is ours, and where is the church you were building?' she asked; 'and where?'

'This is my shanty, Aggy,' said Eltran, cutting short a string of questions which he might have found it difficult to answer; 'and these are some more of my neighbours and my old friends.'

This referred to the few citizens of Great Bucephalus who had been watching the arrival and departure of the 'outfit' from the crest of the mound on which the city was built.

More introductions followed; and while all the residents were very civil and even kind in their manner, yet in their manner was also something which surprised Boytell and, as he found on comparing notes, his fellow-travellers also. A total absence of cheerfulness, and an aspect of gravity, yet combined with a searching look, too apparently characterised the whole.

The new-comers were received by Mrs Eltran in what her husband had called his 'shanty'—a large wooden house, roomy and convenient enough, but so devoid of furniture, that its bare aspect struck quite a gloom and chill upon the strangers, warm though the night was.

'Why, George,' exclaimed Mrs Boytell, 'I thought you had some kind of warehouse or sale-room. Is this it?'

'No, my dear,' said Mrs Eltran, her husband again seeming to have some difficulty in answering. 'We concluded not to keep on our store, and our furniture is nearly all boxed up, as we shall quit this to-morrow.'

'What! Leave this place?' exclaimed the new-comers with one accord, in a surprise not wonderful at hearing this announcement.

'Yes,' continued Mrs Eltran; 'George thought you knew, and—and we consequently did not expect you.'

The speaker faltered in her turn, and looked meaningly at her husband, who, with a palpable effort, said: 'That is just how it is, Polly;' he spoke to his sister; 'and it was to explain this and save you a long journey that I wrote to New York. Of course I thought you had received my letter, and so I was—— However,' he continued with a fresh effort, and a glance, which was perhaps involuntary, at the children, 'you must prolong your travels a little, and go with us—that is all.'

'But where, in the name of all that is unlucky, are we going?' was the very reasonable inquiry of Boytell.

'Why, as to that, you see—just at present,' returned Eltran, who was more confused than ever, 'we do not—in fact, we have not made up our minds exactly where to go.'

'Lor! Good gracious!' ejaculated both the women together.

'And the cattle-farm I was to start on,' said Boytell, 'shall I have to give up that idea? Even if you leave here, perhaps I might'——

'No; it is not to be done now,' interposed Eltran. 'It is too long a story for me to attempt any explanation to-night. All I can say is that we shall start early in the morning; and I expect our first stage will be Strapley's Mills. Phil Trayle is going with us.'

'Strapley's Mills!' echoed Boytell. 'Why, that is the very place where our conductor said he should go to; and I remember now that he intimated it was preferable to Great Bu—— But Mr Trayle going with you! Is he also about to leave the—the city?'

'He is,' returned Eltran, who then changed the subject so decidedly as to show he did not wish to continue it.

This conversation, brief as it was, had increased rather than lessened the gloom which was too palpably settling down upon the whole party; and despite the kindness and attention of Mr and Mrs Eltran, who strove by all the means in their power to bring back some cheerfulness to the group, and to make the new-comers feel at home, the mischief was done, and could not so be remedied. During the further conversation which followed, each member of the party made a feint, to the best of his or her ability, of being absorbed in the topics, and of not being conscious of some separate and concealed matter, over which each one was brooding and speculating; but the veriest stranger could not have been deceived by such pretences, or would have failed to see how ill at ease all were.

At last it was time to put the children to bed—they were a boy and girl of two and four years old respectively—and, with Mrs Eltran, 'Polly and Aggy,' the mother and aunt, went to the chamber which, as the latter were warned, had been so hurriedly prepared for them as to be lacking in some of the comforts which their hostess would fain have supplied, but under the circumstances this was clearly impossible.

Just as the women and children left the room, a citizen, who appeared from his dress to be a teamster, or what we are now prone to term a 'cowboy,' entered, and called Mr Eltran out on some business, to which, with a hasty apology to his remaining guest, he was forced to attend.

Boytell being thus left to himself, decided it would be pleasanter to smoke for a few minutes outside, as the bare room in which he was sitting was very dull, and he thought, also, he should like to see a little more of the city. So he went out; but as regarded his seeing much of Great Bucephalus, he was disappointed. The night was starry and clear; but there was no moon, nor was there a single glimmer from window or door to show that any one was stirring in the place, save that down in a hollow he saw lights and moving figures in what he judged was a stable; and he judged, also, that Mr Eltran had gone there. Anything more blank and cemetery-like, even in the way of a village, he had never before beheld; and the silence and obscurity were scarcely likely to cheer him, or to raise the depressed tone of his spirits.

His reverie was taking a more decided tinge of melancholy, when a voice—so close to him that he was startled, for on the soft earth there the approaching footstep had made no sound—said: 'Why, Squire Boytell, to be sure! Are you taking a survey of our city, Squire?' The

speaker was Mr Phil Trayle, the young fellow to whom he had been introduced, and to whom he had already taken a great liking. He was heartily glad of the interruption; and half-seriously, half-jestingly, spoke of the silence of the place, and of the stables being the only spot which showed any signs of life.

'Yes, that is so,' returned the young man; but there was nothing which savoured of jesting in his tone. 'The citizens are there, or most of them, preparing to leave in the morning.'

'Preparing to leave!' repeated Boytell. 'Are any more of them going?'

'I reckon I saw you introduced to Squire Martleton,' said Trayle; and on receiving an affirmative reply, continued: '*He* is going. In fact, there will not be many citizens left in Great Bucephalus in forty-eight hours from this; that is a fact.'

'Is the place to be deserted, then?' exclaimed Boytell.

'I reckon you have fixed it about the only way it can be fixed,' replied Trayle; 'and we are kinder afraid that we have not deserted it soon enough.'

'But what for? Why are you all going at once?' asked Boytell. 'Is there any fever or infectious illness in the place?'

'Has not our friend Eltran told you yet?' said Phil.

'He has not,' returned the other; 'and seems to evade my questions.'

'I do not much wonder. Yet you and your helpless women ought to know,' continued Trayle, and there was an added gravity in his speech which sounded ominously to his listener. 'I have no doubt that Squire Eltran told you all about it in the letter that you so unluckily missed; but the fact is that the northern Apaches have broken from their reservations, while there are no troops within two hundred miles, and none can be sent for a long time.'

'Troops!' echoed his listener. 'What do you want of troops?'

Trayle laughed at this query; but there was little merriment in his laughter, which indeed ended with something like a sigh, as he continued: 'The troops are wanted right away, if they are to do us any good, for the Apaches mean burning Great Bucephalus; and this, too, means scalping every man, woman, and child in the city, if they come before we have made tracks. I do not mean to say they have not been ill used, and perhaps if I was an Injun, I should be nearly as bad as they are. But they are an awful race in their cruelty, and we hear there are twelve hundred warriors on the war-path, under old Simon the Scalper; that is his American name, you know. He calls himself Abrakalaksh. He is the cruellest brute on the frontier.'

'This, then,' said Boytell, drawing a long breath, 'is why Eltran wrote to me, and why his wife and himself seem so dispirited.'

'That is so,' returned Phil, who was now evidently disposed to go on and complete his history. 'Yet, stranger, if you would be safe in any man's house, it would be in Squire Eltran's, for all the Injuns liked him, and both friend George and his wife were always kind to the squaws and papooses—papooses are the children, you know—and in an ordinary way they would

have died for either of them. But this is not ordinary, and all the warriors must follow Simon on the war-path. Matters might be better but for some white loafers and scallywags who ought to have been lynched long ago.'

'Some what?' exclaimed Boytell, who was of course painfully interested in the narrative.

'Loafers and scallywags,' repeated Trayle; 'outlaws and traitors who have either joined the Injuns, or are advising them what to do; and these scoundrels have a spite against Great Bucephalus, as we did lynch two of them here last spring. If the Injuns had not stopped to burn two towns on their road, they would have been here to-day. As it is—— Do you see that man there, just at the corner of the fence?'

'Yes; I see him.'

'Well, that is one of our scouts,' continued Phil. 'We have had three out every night since the alarm was given. Red men never attack at night, as a rule; but with nearly all tribes there is a set of outcast, cowardly, bad Injuns, whom these whites would be sure to get hold of, and teach them everything that is cunning and dangerous, so we may have to fight at any hour.'

'And this Strapley's Mills that you have spoken of,' said Boytell, 'and that our wagons were going on to, what sort of a place is that?'

'I estimate that your boss driver had heard more than he chose to tell you,' answered Trayle. 'I never saw a man in such a hurry to get away. —Well, Strapley's Mills is a stone building; and all the Injuns on the planet could not take it, if they did not starve it out; while, as there is nothing there but the mills and the shanties for the men, old Simon is not likely to waste his time and risk his warriors where it would be all fight and no plunder. We shall be safe there for a day or two, until, perhaps, we can get further intelligence; but we cannot make a great stay, as there will be no provisions beyond what we carry along ourselves. For a time we shall be safe in the enclosure between the mills, and that is something.—See! Squire Eltran has come back, and is looking around for you. I shall start with you in the morning; so good-bye until then.—I reckon your friend Eltran will be glad to find you know the worst.'

Boytell thanked the kindly young fellow, and then turned towards the house, at the door of which, visible by the light of a lamp in the room behind him, Eltran could be seen peering out into the night, in quest, doubtless, of his absent friend.

LYLY AND THE EUPHUISTS.

Few of the grand army of novel-readers ever suspect that they are in anyway indebted for their innocent merriment to the old Elizabethan writer John Lyly; yet, both as regards matter and style, the novel bears unmistakable traces of a useful legacy bequeathed by this almost forgotten author. M. Jusserand, the pleasant and painstaking writer on English life and literature in the days of long ago, has recently shown how Richardson, and through him modern fiction as a whole, owes an eternal debt of gratitude to that once popular romancist, the author

of *Euphuës*. It may be necessary to remind a few readers that he was born in or about the year 1553; thus first seeing the light about the same time as his great contemporary, Edmund Spenser. As in the case of Shakespeare, very little is known with certainty of his life. We know that he was a little man, that he was married, and fond of smoking and reading, and that is nearly all. He entered Magdalen College, Oxford, in 1569, and took a degree. In 1579 was published his book, *Euphuës, or the Anatomy of Wit*, which proved to be the most popular romance of the sixteenth century. It gave a name to the affectation in style and speech already in vogue, of which it was the most elaborate and powerful representation. 'Euphuism,' as it is called, was not only fashionable with the literary worker, but even amongst the ladies of Elizabeth's court. Sir Henry Blount, in his preface to some of Lyly's dramatic pieces, says: 'That beauty in court which could not parley Euphuism was as little regarded as she which now there speaks not French.' It had a brilliant if somewhat chequered career, and was the prevailing literary taste for a quarter of a century; and the praise or dispraise or mere reference by contemporary and succeeding writers is of frequent occurrence. Shakespeare, in his *Love's Labour's Lost*, tilts at the popular style with his usual wit and poetry—in the following lines amongst others:

Taffeta phrases, silken terms precise,
Three-piled hyperboles, spruce affectation,
Figures pedantical;

His treatment of it was, however, mild and good-natured, and it is safe to say that he always regarded it with a kindly eye, and occasionally adopted the style. In *Henry IV.*, he makes the King say to Prince Hal: 'Though the camomile, the more it is trodden on the faster it grows, yet youth the more it is wasted the sooner it wears.' Ben Jonson ridicules and Drayton satirises Lyly in his panegyric on Sidney, as

Playing with words and idle similes,
As th' English apes and very zanies be
Of everything that they do hear and see,
So imitating his ridiculous tricks,
They spake and writ, all like mere lunatics.

Sir Walter Scott, in the *Monastery*, gives an unfavourable picture of 'Euphuism,' and introduces Sir Piercie Shafton as an example of the old Euphuists. This study of the great novelist's is, however, generally considered more of a caricature than a likeness. Kingsley, on the other hand, introduces the subject into his romantic *Westward Ho*, and speaks of *Euphuës* as a 'brave, righteous, and pious book.'

There is some little difficulty in defining what Euphuism really is, owing to the indiscriminate use of the word as a kind of synonym for the artificial wit and general affectation of Elizabethan times. The distinctive characteristics of Lyly's Euphuism are now considered to be transverse

alliteration, elaborate antithesis, and a redundancy of similes from simple phenomena or fabulous natural history. As Sir Philip Sidney says:

Or with strange similes enrich each line
Of herbs or beasts, which Ind' or Africk hold.

The simple stringing together of many words beginning with the same letter, as exemplified in the line 'apt alliteration's artful aid,' had but few charms for Lyly. His style is more complicated and difficult, the alliteration being skilful, intricate, and subtle. To give a correct idea of the transverse method it is necessary to quote an example: 'I have shrined thee in my heart for a trustie friende, I will shunne thee heerafter as a trothles foe.'

The following quotation will serve as a specimen of the remaining two chief characteristics: 'The fine christall is sooner crazed than the harde marble, the greenest beech burneth faster than the dryest oke, the fairest silke is soonest soyled, and the sweetest wine tourneth to the sharpest vinegar.'

Lyly must not be credited with the introduction of Euphuism, though he was the first to bring it to perfection. Two years before *Euphuës* appeared, George Pettie had published *A Petite Pallace of Pettie his Pleasure*, which book contains the chief elements of Euphuism. It was, indeed, scarcely of English growth at all. The history of its origin is interesting, but by no means complete or satisfactory. Many literary historians regard it as merely one of the extravagant follies which came in at the Renaissance, when each country tried to cultivate a vernacular literature, and avoid the servile imitation of Greek and Latin writers. Others have thought it was the natural result of the predominance of Italian literary influence in the sixteenth century, as it is well known that attempts were made to 'Italianate' the English language. It has also been awarded a French origin, and likewise attributed to the mannerism of some one single writer. The names of Du Bartas, Marini, and Guevara, respectively, have been submitted as claimant for the honour of paternity. There is but little doubt that Lyly was acquainted with the works of Guevara, and, like many greater Elizabethans, was not altogether guiltless of the 'higher plagiarism.' Don Antonio de Guevara, a Spanish ecclesiastic and author, published his *Marco Aurelio* in 1529; and it was 'done into English' by Lord Berners a few years afterwards with great literary and commercial success. The leading features of Euphuism are here present: the transverse alliteration, the fantastic and far-fetched illustrations or similes, and the somewhat monotonous antithesis. Like *Euphuës*, it is innocent of anything resembling a plot, and is mainly composed of soliloquies and dialogues on moral and patriotic questions. The Spaniard, as well as the Englishman, also draws largely on Plutarch for ideas, in many parts the Roman writer being almost literally translated.

But whatever may be its origin, Lyly was the first to make it a literary force in England, as he was also the earliest writer to recognise the moral idea as worthy of artistic treatment in fiction. His reflective passages contain many beautiful ideas and sound practical wisdom, and the modernness of his views is quite astonishing. The French critic already mentioned points out

how he anticipates Rousseau in his attack on the artificial life of the period. That perennial subject for the wit of satirical philosophers—namely, the dress of fashionable ladies—is vigorously denounced. ‘Take from them their periwigs, their paintings, their jewels, their rolls, their bolsterings, and thou shalt soon perceive that a woman is the least part of herself.’

It is interesting to find that he is at one with Mr F. Galton and other philosophers of the ‘heredity’ school, and makes practical as well as antithetical use of the words Nature and Nurture. And he attacks the superstition, which no doubt even then prevailed, that education is the sovereign panacea for all human inequality and misconduct.

Besides his two Euphuistic books, Lyly also wrote several dramas, and was the earliest writer to recognise that prose is better adapted than verse for the purposes of comedy. The wit of his dialogues has often been praised, and it was more than appreciated by later dramatists. As a lyrical poet he is perhaps best known by his ‘Cupid and Campaspe,’ from his first comedy *Campaspe*, which is often found in books of elegant extracts and popular pieces. In 1589 he had the imprudence to take part in the fierce Martin Marprelate controversy and write the pamphlet *Pappe with an Hatchet*. In return, he and his friends were vigorously attacked by that acrimonious pedant, Gabriel Harvey. ‘Nash the ape of Greene, Greene the ape of Euphuus, Euphuus the ape of Envie,’ was one of the discourteous and rather personal remarks of his opponent. Greene, the brilliant but dissipated genius, also belonged to the Euphuistic school. In the same year (1580) as the second part of *Euphuus* appeared, he published his *Mamillia; a Mirrour or Looking-glass for the Ladies of England*; and in 1589 he brought out *Menaphon; Camila's Alarm to slumbering Euphuus in his Melancholy Cell at Silexedra*. These are his chief works in the Euphuistic style, which in his hands was as eloquent and poetical, if not as elaborate and fantastic, as that of Lyly. Thomas Lodge's *Rosalynde* was, next to *Euphuus*, the most popular work of the day. Though it contains but little action and too much tedious dissertation on the moral and courtly virtues, it is a book which fully deserved its great popularity. Shakespeare, as is well known, was greatly indebted to this old idyll when writing his *As you like It*.

Thomas Nash, the literary soldier of fortune and pamphleteer, is usually classed among the Euphuists, as his style bears many traces of the prevailing fashion. A few lesser writers, like Munday and Chettle, wrote in the orthodox vein for a few years longer; but, as with all literary and political fashions, it eventually died out.

In modern times, Lyly has been criticised with varying results by different writers. Hallam contemptuously dismisses *Euphuus* as a ‘very dull book;’ while Taine says its author was ‘at times a genuine poet; a singer, a man capable of rapture, akin to Spenser and Shakespeare.’ Another critic, after many disparaging remarks, has to admit: ‘Perhaps, indeed, our language is after all indebted to this writer and his Euphuism for not a little of its present euphony.’ That is a great admission, and it is not far from the truth. Much of the best writing in later days

manifests clearly its indebtedness to Euphuism. Dekker, who followed Lyly, Greene, and Nash, as poet and pamphleteer, was, it is safe to assume, the first of the moderns. He had wit and learning, ‘with poetry enough for anything;’ and the prose of *The Gull's Hornbooke* and *The Seven Deadly Sins* surpassed anything of its kind before produced in England. To him and Lyly we should be thankful for such improvements in the style and diction of our language as led gradually and naturally to the rich, quaint, and delicate work, with its *curiosa felicitas* of phrase, done by men like Sir T. Browne, Fuller, Addison, and Charles Lamb.

IRMA'S LIONS.

THE life of an acrobat in Western Europe, says a well-known gymnast, is—apart from the accidents incidental to a dangerous profession—an uneventful one, and my own experiences were no exceptions to the rule. Acrobats and gymnasts, however, are generally cosmopolitans, and an able performer in the course of a long career visits some of the remotest parts of the world, where occasionally he meets with curious adventures. I was once at Odessa with the equestrian troupe of Frederick Renz, when the following romantic circumstance took place. Amongst the performers in this excellent company was a young female lion-tamer named Irma Delavanté. Irma at all times was a quiet and lady-like young woman, much the superior of the majority of the girls who figure as riders or acrobats in circuses and variety shows. She was a remarkably handsome and graceful artiste, and had maintained her self-respect in a public position that is so often fatal to the reputation of a young and beautiful woman.

My own performances had been the chief attraction at all the shows I had appeared at up to the time I was engaged at Renz's, where I found a formidable rival in the fair ‘Lion Queen.’ Irma's lions were two magnificent specimens of the majestic animals Jules Gerard liked to encounter on moonlight nights in the deserts and forests of Algeria. I will not enter into details of the performance; I must say, however, that it was a grand and thrilling spectacle of the mastery of mind over matter. The performances took place in the arena, which was enclosed in a massive iron railing. (At the present time a similar railing protects the audience of the Cirque Nouveau at Paris when six lions are in the ring.) By this arrangement ample space was secured for the marvellous leaps of the lions that formed the exciting finale of the exhibition. Irma Delavanté's instincts were essentially artistic, and I often thought her well-arranged groups would have delighted the eyes of a Landseer or a Rosa Bonheur. I took a great liking to this intelligent young lion-tamer, and passed many agreeable hours in her society. I was not, however, in love with her, though one man in the circus company seemed to think I was.

Irma's lions were named Nero and Leo. A year before I knew Irma, she had nursed the former through a dangerous illness, brought on by the excessive cold of a Russian winter; and the noble animal was in consequence deeply attached to her. Leo was a sullen and vicious brute, requiring incessant watchfulness to keep it tractable for the arena.

I had not been long at Renz's before I perceived that Irma Delavanté had two lovers in the circus troupe. One was a fine manly young fellow named Henri Monfroid, a bareback rider professionally. The other was a boorish Russian, with a villainous cast about the eyes that made him look the perfection of ugliness. I need hardly say that Henri was the favoured suitor. For some reason or other, the big Russian got the notion into his head that I was also enamoured of the fair lion-tamer; and as the fellow was of a jealous and brutal disposition, I should certainly have had cause for uneasiness had it not been for Irma's open partiality for young Henri. Irma had several times rejected Orlof's addresses; so the burly Russian told me himself; and on these occasions, when he made me an unwilling confidant, he invariably assured me that he would be revenged. The emphatic manner in which he used to utter these threats, and the dark look that came over his face at the time, convinced me that the murder of Henri Monfroid was not at all an unlikely possibility; and I deemed it my duty to warn the young equestrian of his danger. The young fellow, however, made light of it, and assured me there was no danger, as Orlof was too great a coward to face a resolute man. For Irma's safety neither I nor Henri had any misgivings. Strange that it never occurred to either of us that her death-blow would strike him more cruelly than the assassin's knife.

One day about six weeks after my arrival at Odessa, I caught cold, and feeling very ill, I sent word to the circus that I could not perform that night. In the evening, I felt better, and I went out for a walk through the splendid boulevards erected by the Duc de Richelieu. About half-past nine I went into a café close to the circus and called for some refreshment. I had not been there long before the Russian Orlof came in and called for brandy. The place was almost deserted; we were the only customers present. As soon as Orlof perceived me, he came and sat down by my side, and I saw at once the man was drunk. After greeting each other, we both smoked on in silence.

The Russian sat moody and silent for some time. 'Englishman,' he said suddenly, 'I've revenged us both.'

'What do you mean, Orlof?' I exclaimed in alarm.

'Revenge, man—revenge!'

'On whom?'

'On her.'

'You've murdered her; you'—

'No!' he interrupted with drunken gravity; 'I have not injured a hair of her head.'

Somewhat relieved, I smoked on in silence.

Presently Orlof resumed talking: 'You were after her, too, Englishman. Did she spurn you as if you were dirt under her feet? the cat!—Listen, man. Though neither you nor I can

have her, that scélérat Henri will not win the prize.'

'What have you done?' I asked.

He was silent for a few moments, and then he told me the whole truth; and truly a more diabolical murder than this man had premeditated had never yet been conceived. A few minutes before he came away from the circus, he had given the lion Leo a piece of meat containing a drug that would most certainly irritate and madden the savage beast just at the very time it would be in the circus with its mistress.

I turned pale as death when, after he had told me his story, I realised the awful peril of the young Lion Queen. I glanced at the clock; it wanted a few minutes to ten. I might possibly be in time to warn the girl; and trusting it might be so, I rushed out and ran as hard as I could to the cirque. When I arrived there, I ran through the stables to the artistes' entrance into the arena. I was too late; the bars were up and the performance had begun. Naturally, the circus people were astonished at my appearance, and half-a-dozen stalwart grooms caught hold of me and drew me back. In vain I struggled, and equally in vain I tried to make myself understood. I was trying to do so when a loud roar sounded above the martial strains of the music that was generally performed when Irma's lions were in the ring. Instantly the noise of a terrible commotion made itself heard from the other side. The Russians now loosed me, and we all ran up into the amphitheatre. Here the scene beggars all description; men were shouting and gesticulating, while women were screaming or fainting all around the circus. Making my way through the crowd, I ran down to the barred ring where Irma Delavanté lay prostrate under the claws of the lion Leo.

In the meantime the circus people seemed paralysed, and no determined effort was made to drive the lion off. Red-hot irons were procured; but they were too short, and no one dared to enter the ring. The one man (Monfroid) who would have done so was absent. Suddenly all eyes were attracted to Nero, who was standing in a part of the ring opposite to where I stood. To my dismay, I perceived that the majestic and noble animal was preparing for a spring. With a roar that, like a clap of thunder, seemed to shake the building to its centre, the animal in one bound flew across the arena and dashed with irresistible force against the other lion, sending it flying like a shot from a gun against the iron bars of the circus. In an instant the lions sprang at each other and engaged in a terrible conflict; and while they were settling old scores, I entered the ring and carried out the insensible form of the young lion-tamer amidst the ringing cheers of the excited audience.

Fortunately, a surgeon was at hand; and before we left the circus we were all greatly relieved by his assurance that the wounds the maddened animal had inflicted were not of a serious nature.

While the doctor was examining Irma in her dressing-room the circus people were doing all that was possible to separate the two lions; however, this was not effected before Leo was killed by its more powerful antagonist. Nero, however, had been so fearfully mauled that—to

the genuine sorrow of every one in the troupe—the noble brute had to be shot the next morning.

A few minutes before the faithful animal was killed, I was seated in the *salle-à-manger* of the *Café de Paris*, when an official of the police entered and sat down opposite to me.

'Your name, nationality, and occupation?' he demanded curtly.

I told him; and in answer to several queries, I told him all I knew about the drugging of the lion. 'You have arrested Orlof, I suppose?' I said in conclusion.

'Certainly, sir; and you yourself are under arrest. You must on no account attempt to leave Russian territory until this matter has been submitted to the consideration of the Emperor. For your own sake, I advise you not to leave Odessa without express permission of the authorities. You will be under constant surveillance until his Imperial Majesty has given his decision.'

'Surely, sir, you do not imagine I have had a hand in this affair?' I said, aghast.

'No! We shall have to detain you as an important witness, whose evidence will be necessary, should the Czar order a trial.'

A month elapsed before the Emperor's decision was sent to the Odessa authorities, and all that time I was kept virtually a prisoner in the Black Sea port. This was all the more arbitrary as all the other members of the troupe, including Irma herself, were permitted to go where they wished.

I am happy to say that I was released in time to be present at Henri and Irma's wedding, which took place at Constantinople the day after I arrived there.

By order of the Emperor, Orlof was sent to Siberia without undergoing so much as the formality of a trial; and his Imperial Majesty tempered this act of despotism with a very graceful one that was much approved of by the citizens of Odessa. The courier who brought His Majesty's decision also brought a magnificent and costly diamond bracelet, the present of the Emperor to Mademoiselle Irma Delavanté.

Some of the readers of this *Journal* may possibly remember the appearance of Franconi's equestrian troupe at the London Alhambra nearly thirty years ago. If so, they may also be able to call to mind that the best feature in Franconi's show was the daring and graceful horsemanship of Madame Irma Monfroid, an artiste whose fair and comely features were marred by a frightful gash on the right side of the face.

UPON BEARDS.

And wildly tossed from cheeks and chin,
The tumbling cataract of his beard.

Tales of a Wayside Inn.

LIKE many another thing insignificant enough in itself, the human Beard has played an important part in the affairs of mankind, so much so, that we find it to have been the cause of a long and bloody war between the Tartars and Persians, co-religionists, from the former declaring the latter to be infidels merely because they refused to trim their beards in accordance with a certain rite.

Some of the customs and ceremonies pertaining to this facial appendage, in vogue among different peoples at different times, are sufficiently curious to deserve mention; and we notice that nearly every calling and profession has in its turn been subject to stringent regulations regarding it. In the same way as the wearing of beards, with certain few exceptions, is prohibited in our army in the present day, so, among the ancient Romans, military men wore it short and frizzled. Alexander commanded the Macedonians to shave themselves, lest the length of their beards should give a handle to their enemies; while, on the other hand, among the Catti, a nation of Germany, a young man was not allowed to shave until he had slain an enemy. But perhaps ecclesiastics have suffered most. At one time they have been enjoined to wear beards, from a notion that it was effeminate to shave; and at another, not to, on the score that they might take pride in them, like the kings of Persia and some of the first kings of France, who had them woven and matted together with threads of gold. After the introduction of Christianity, the Anglo-Saxons obliged their clergy to shave, in obedience to the laws and in imitation of the Western churches; a distinction between them and the laity of long duration, concerning which a writer in the seventh century complained that the manners of the clergy were so corrupt that the priests could not be distinguished from the laity by their actions, but only by their want of beards.

As a distinguishing mark, Perseus seems to have been so convinced of the beard being the symbol of wisdom, that he thought he could not bestow a greater encomium on Socrates than calling him '*Magistrum barbatum*.' Slaves among the Romans wore their beard and hair long. It was always in olden times, and is still among the Hindus, a sign of grief or joy according as the custom was to wear it or not; thus, the Romans, who shaved daily, suffered it in times of grief and affliction to grow; while the Greeks, who wore them, shaved at such times, like the Hindus. Potter, in his *Archæologia Græca*, tells us that in solemn and public mournings it was common to extend this practice to their beasts, that all things might appear as deformed and ugly as might be. Thus Admetus, on the death of Alcestis, commands his chariot horses to be shorn:

My chariot horses, too, my grief shall share;
Let them be shorn, cut off their lovely manes.

And Alexander, at the death of Hephestion, not only cut off the manes of his horses and mules, but took down the battlements of the city walls, that even the town itself might seem to mourn, and instead of its former beauteous appearance, look bald at the funeral.

Among the Normans, to allow the beard to grow was an indication of the greatest distress and misery. It is mentioned by some of our ancient

historians, as one of the most wanton acts of tyranny in William the Conqueror, that he compelled the English to shave their whole beards, and that this was so disagreeable to some, that they chose rather to abandon their country than resign their whiskers. Among the Turks, it is more infamous for any one to have his beard cut off than almost anything else, and there are many in that country who would prefer death to such disgrace.

With regard to religious ceremonies, the day on which a Roman or Grecian youth removed the first growth from his chin was held as a festival; visits of ceremony were paid, and presents made to him, while the down itself was consecrated to some god, usually to the Lares. Nero consecrated his in a golden box, set with pearls, to Jupiter Capitolinus. By the statutes of some of the old monasteries, the lay monks were to let their beards grow and the priests among them to shave. The beards of all that were received into the monasteries were blessed with a great deal of ceremony; and there are still extant the prayers used in the solemnity of consecrating the beard to God, when an ecclesiastic was shaven. The Russians wore beards until near the close of the last century, when their Czar enjoined them all to shave; but, notwithstanding his injunction, he was obliged to keep a number of officers to cut off by violence the beards of such as would not otherwise part with them. He also levied a tax on long beards, which many submitted to rather than part with what was universally held to be an ornament to the person. The superstitious among them thought it to be an external characteristic of the orthodox faith; and those who were too poor to pay the tax, religiously preserved their shorn beard, and had it deposited in the coffin with them on their decease, that they might present it to St Nicholas, on his refusing to admit them, as beardless Christians, into the kingdom of heaven.

The fact of Philip V. of Spain ascending the throne with a shaved chin gave rise to the Spanish proverb, 'Since we have lost our beards we have lost our souls,' for they were in a manner bound to follow his example. The Arabs make the preservation of the beard a capital article of religion, because Mohammed never cut his. The Moors of Africa hold by their beards while they swear, in order to give validity to their oath, which after this formality they rarely violate. The Turks when they comb their beards spread a handkerchief on their knees and gather very carefully the hairs that fall. When they have got together a certain quantity, they fold it up in paper and carry it to the place where they bury their dead—a custom similar to that of the ancient Greeks, as we find in *Æschylus*:

I see his hair upon the grave;

and in Ovid, where Canace bewails her misfortune in being debarred from performing this ceremony to her beloved Macaræus:

'Twas not permitted me with briny tears
To bathe thy lifeless corpse, or bring my hairs
Unto thy sepulchre.

Anointing the beard was an ancient practice

observed in serious visits, where the ceremony was to throw scented water on the visitor's beard, perfuming it afterwards with aloes wood to give it an agreeable smell. Plucking the beard was a sign of contempt, a practice which tried the patience of both Stoic and Cynic, in spite of their affected insensibility to insult or injury. Touching the beard was an action performed by supplicants towards those whose compassion they wished to excite; while among the ancient French, touching or cutting off a small part of it was the most sacred pledge of protection and confidence. For a long time, all letters issuing from the sovereign had, for greater satisfaction, three hairs of his beard in the seal. A charter of 1121, still extant, concludes with these words: 'And that this writing may go down to posterity firm and stable like the oak, I have applied to my present seal three hairs of my beard.'

SUDDEN CHANGES.

THIS morning in the meadows there were drifts of
daisies bobbing,
Swaying backwards, swaying forwards in a careless
sort of way,
And the daffodils were merry, and the soft south wind
was robbing
Scented larch-woods of their sweetness, and my heart
was light and gay.

And the blackbird's song was ringing by a nest hid in
the bushes,
Where a soft brown head was lifted list'ning to his
fervent vows;
And the happy, shifting sunlight gleamed above the
brake and rushes,
Resting lovingly a moment on the beech-trees' golden
boughs.

All the earth was fair and gladsome, and the sky was
blue and tender,
With the fleecy cloudlets drifting o'er its surface white
and gray;
Now the sky is dull and clouded, faded is the
sunlight's splendour,
And I wonder how I ever said the world was bright
and gay.

For the constant noisy chorus of the birds is really
vexing,
And to fancy any mortal thinks the buttercups like
gold!
While the daffodils' and daisies' foolish movements
are perplexing,
And the wind that sets them dancing is quite wintry-
like and cold.

Hark! a step upon the gravel, and a laugh—'tis
surely Willy
Who is passing in a hurry through the narrow garden
gate.

Well, I don't mind now admitting that I have been
cross and silly
With the world, because my lover chanced to be an
hour too late.

A PICTURE-GALLERY.

HAS it never struck you that you possess a private Picture-gallery, whose door will open to you alone? At any time, but most in times of solitude, you can unlock this door and tread with solemn pace into the sacredness of its seclusion. It is almost like treading the hushed aisles of some vast cathedral—more impressive in its emptiness than when it is thronged with worshippers. Every one of us has such a gallery. When we are young, the pictures are new, and perhaps lack their finishing touches; there are also many empty spaces. The light, also, is too bright to allow the true effect, so that we see little of the pictures, our eyes being filled with sunshine. But as time wears on, the empty places become filled up and the light changes. It becomes vividly bright in parts; but it begins to cast shadows. The room available for other pictures becomes less and less, and only those with exceptional claims can be admitted. Those already on the walls become reverend and almost sacred. Aureoles play around some of the heads. Sometimes—when there is something wrong with us, something coming between our souls and the light—we are afraid to enter at the door. If we do, we must take the shoes from off our feet, for the place is holy ground.

Heavy curtains hang before some of the pictures, curtains which are seldom drawn. Before others, perhaps, tapers are burning, as before an altar. No stranger may be admitted into this sanctuary; and if the owner wishes that others should know his pictures, he can but take poor copies and bring them forth for public gaze. The copies are never like the originals. Some of our galleries contain pictures which we long to show to others, but we dare not—pictures which are terrible to us as we stand and gaze at them alone, but whose horror might be greatly lessened could we hold a friend's hand the while.

One or two of the pictures in my gallery are so old that I cannot possibly ascertain the date. I

do not think they can be older than the period of my own existence in this life, but even that is not quite certain. Only a few indistinct and wavering lines are visible amid absolute darkness. We came from God 'trailing clouds of glory'; perhaps some of these pictures came with us then. That is merely a conjecture, a pleasing sentiment. But there are others almost equally indistinct, whose dimness may be accounted for naturally. Dust and cobwebs mantle around them, not to be displaced by any effort of ours. Perhaps the time will come when these pictures shall be given into the hands of the great Restorer, and all stain shall be removed from them. How will they look then, when brought forth to the light? Ah, we shall not want the pictures then, for we shall have the originals.

What picture is this before which I am now standing? There is a dimly-lighted room, and a little child lying in his white bed. By that bed sits a figure; it is too dusk to see her face, but she is singing the child to sleep. The child's face is more visible, and on it is a look of sickness and pain. Hush! I can hear the very tones of her voice. Let us turn aside from this; it is too sacred, too touching.

The next picture before which I stop is one that it is easier to speak of. It is the face of a little girl, perhaps twelve years old, with rosy cheeks and bright eyes. Possibly you may not call her beautiful; but all the fresh prettiness of childhood is there; and in somebody's eyes she was once all that is beautiful. How easy to build a romance on that laughing girlish face!—the child-playmate, the betrothal, the wedding. Does the romance continue after the marriage? It ought to do so, and should include the faithful wife, the loving mother. Alas! in this case no such romance can possibly exist. There is the picture of the bright-eyed child, and nothing beyond. Perhaps if the portrait were taken now, she might have become stout and commonplace; but I would rather not think of that. The little girl-playmate is a 'joy for ever,' not to be lightly surrendered. What have such things to do with

time and space? They partake of eternity. I feel sure that, somewhere and somehow, I shall play once more with my little companion, and both be children again. This is another foolish sentiment, for the world to laugh at; but there are some who will not laugh. They know too well that they have similar pictures of their own, treasured in secret, and similar fancies.

Then there is the old house in which I played with this little girl—not her home, but the home of two old friends. We played Hide-and-seek among the dark cupboards and passages, making more noise in a few hours than our worthy friends did all the year round. One cupboard was said to be haunted, and we peered into its shadow with fear and trembling. It is true that we sometimes saw two living sparks glowing in the darkest corner; but that was only the cat. Sometimes our good old friend would read to us; but we, laughing children that we were, enjoyed the byplay of our own mirth more than the most classical narrative. We would listen at whiles, and then break into half-smothered merriment. I fear we sometimes professed to be hugely amused with what the old man was reading, when all the time it was our own childish fun that tickled us. Innocent deception! The old man smiled benignly, and proceeded with his reading.

In the summer-time we gambolled in the large old garden, with its fruit-trees and vegetable beds, its mossy paths, and the old roller that I loved to drag along. How pleasant it was to play Hide-and-seek among the raspberry canes, taking advantage of the fruitful neighbourhood meanwhile! Fruit seems to have lost its flavour since those days; or is our taste spoiled by fruit from the forbidden tree?

But there came troublous times to these good old friends—troubles which we children could little understand, and still less help. I remember standing in the garden one autumn afternoon, and watching the public auctioneer, with red face and loud voice, as he made short work of my friends' few effects. Strangers were pressing rudely up the steps and in the rooms that had been made beautiful by our happiness. My boyish indignation availed little to check this shameful sacrilege, nor were the tears of the good woman herself more effective. All this is past now; my old friends are gone, and the little girl-playmate is I know not where. Alien footsteps resound in the passages where we sported together; and as I pass the windows, I look in vain for the 'old familiar faces.' But it all lives still on the walls of my portrait-gallery. Would that there were no darker picture!

I have portraits of other companions—some now dead, some far away, some estranged. Some have chosen a good part; some have fallen on evil days. There is a picture of a boy with whom I often played in these days of sunlight. He had a genius for getting into trouble, and would manage to soil his clothes upon the finest of summer days. But in spite of all this, and in spite of parental chastenings, a perennial fountain of enjoyment welled up within his heart. He could extract mirth from the most dismal surroundings. I knew this mirth fail him on one occasion, however. We had been trespassing on some rich meadows in search of flowers, and the farmer

caught us. He did not lay hands on us, but merely ordered us to walk off to the gate, himself following behind. My comrade at once concluded that he meant to kidnap us, and cried lustily. I had to play the part of comforter, although the vague idea of being kidnapped was very dreadful even to me. But he plucked up heart and began to be brave when he saw that the farmer had no such designs. It has since struck me as a most ludicrous fancy that any one should covet the possession of troublesome boys like ourselves.

One of our exploits, I remember, was decidedly picturesque and fanciful. There was a stream near our home which in one part flowed under a long low tunnel where the railway passed above. We managed to procure a piece of candle, and this we placed on a small bit of board. Lighting the candle, we then entrusted it to the current of the stream at the mouth of the tunnel. We then ran round speedily to the other side, trespassing on the rails in order to do so more quickly; though we need not have made such haste, for the current of the stream was slow. With breathless anxiety we waited for the appearance of our light. Would it safely pass the perils of the way? It might overset and disappear; drops of moisture from the roof might extinguish it; sticks or stones might impede its course in mid-stream. Our fears were natural; but happily good fortune attended the little argosy, and its small star appeared at last in the darkness, hailed with loud shouts and acclamations of joy. What a surprise it must have given to the water-rats!

One is inclined to grow garrulous when speaking on such subjects, forgetting that what is of so great importance to ourselves may not interest others in the least. It is always better to say too little than too much, especially in confidences such as these. Trifles sometimes slip out which calmer moments might wish to have preserved. I withdraw from my portrait-gallery, and quietly close the door.

A SOLDIER AND A GENTLEMAN.*

CHAPTER V.—BEFORE THE ACTION.

FERRERS as he walked away felt angry and humiliated. He was not usually a vainly longing person. He had been well content to serve in his humble rank as a soldier, and to have Lord Debrett for a friend without wishing to be taken as Lord Debrett's equal. He would have been satisfied to go on like that; but to be set up as a gentleman by one hand and taken down by another was 'not good enough,' as he said to himself. To be introduced to a very nice girl—to a young lady, indeed—and then to be rudely pushed away from her, was especially a thing that no right-minded man could endure. He felt very much inclined to 'kick over the traces' (to use his own words), to pull Sir William's nose and call him an insolent jackanapes, and then throw up the whole business. He was as well disciplined and docile a soldier as could be, except where his heart was concerned, and about that he had never been asked to accept dictation or discipline.

So he marched along fuming, marched till his anger had become fainter; and then he

[* Copyright reserved in the United States of America.]

went to the house in Jermyn Street—next door to Sir William's own lodging—where the baronet had secured him a bedroom.

Next morning, his resentment was gone. He was himself again—the cheerful, alert, and self-reliant soldier. Whilst shaving and dressing he turned over in his mind all his talk with Miss Dawlish, and the conversations relating to himself which he had overheard the evening before—that of Sir William and his sister, and that of the 'Johnnies.' He experienced a certain fierceness of resentment at the thought that personally he must hold aloof from any tender fancies about the charming Dolly. If the 'Johnnies' were to be believed, he was playing the part of a man who some years ago had been cracked in reputation if not in head. And if Sir William and his sister were to be believed, the baronet was playing a very risky game, in which he, Ferrers, was intended to be an ignorant tool, to be thrown aside as soon as done with. Naturally, Ferrers did not quite approve of that. He owed Sir William neither love nor—so far as he could see—gratitude; and he was therefore determined to find out the secret of his game, and have, if possible, the 'pull' of Sir William, when that grinning gentleman should show a desire to cast him off.

'What,' he asked himself, 'does he really want with me?' He arrested the razor on his cheek to consider a suspicion that rose before him. 'I believe,' he declared to himself, 'the real W. D. is dead, and he wants to work me off as his son, to get somehow at that money his banker-brother left!'

The more he examined that suspicion, the more he got convinced of its truth, and—as is the way of men—resolved to find evidence in support of it; so he made up his mind to wait, and watch, and see, to be no party to doing wrong to any one—if he should discover that was being attempted—and at the same time, as became an old campaigner, not to suffer grievous damage himself.

He went to breakfast with Sir William, and the baronet was fairly affable, but quite close about his business.

'Here,' said he, with a grin, 'is another invitation for you—from Drumly—for to-morrow afternoon—a conversazione or some nonsense of that sort. You'd better go; you'll get on all right, as you did last night. The only thing I have to ask of you is not to hold conversation with Miss Dawlish—if she's there.'

'Very well,' said Ferrers.

Ferrers went to the conversazione. What it was about, he neither knew nor cared; but he saw strange glass cases in the drawing-room, containing specimens or representations of grains, pulse, and fruits, and he saw a little book called *How to live on Sixpence a Day*, and he thought, 'I know; I've done it; but I'd rather not.' Dolly was there, but so was Aunt Dawlish. He thought Dolly regarded him wistfully from afar off, and he worked slowly round the room to be near her. He passed close to her and glanced at her.

'How d'ye do, cousin?' she said. But she did not move; she scarcely looked as if she had spoken.

'I am told,' said he, much in the same manner,

'that I must not hold conversation with you. Why?—I don't know.'

'Isn't it absurd?' said she, still without turning. 'Aunt Dawlish has told me I mustn't talk to you. What for? I wonder. Have you offended her? She used to be always praising you to me.'

'Aunt Dawlish,' said Ferrers aside, 'is an old catamaran!'

'Yes,' said Dolly, angrily turning her eyes, but nought else. 'Isn't she an old frump? Old maids are always like that, I suppose. I hate them!'

'Good-bye,' said Ferrers.

'Good-bye, cousin,' said Dolly rather plaintively.

Aunt Dawlish had always been praising him until now—praising, that is, the other, the mysterious, the unknown, the 'cracked' in reputation or in head—the probably dead—Will Dawlish! That was another fact to be taken note of and pondered.

While he turned over and pondered these things, and paced solemnly about the room, he remarked the black-muzzled Irish-American, whom he had soused in the fountain, and whom he had seen at Mr Drew's the evening before. He moved about as if burdened with the cares of office. It was clear, then, that he was in the service of either Drew or Drumly, or that he served the two masters, either of which conclusions was disconcerting; for it seemed likely that he would encounter the man frequently. Indeed, he was presently both disconcerted and surprised to see the man approach him and to hear him say: 'Mr Dawlish?'—with a look, Ferrers thought, of suspicion and incredulity.

'Yes,' said Ferrers.

'Mr Drumly,' said the man, 'has sent me to find you. He wants to speak to you.'

'What now?' thought Ferrers, as he worked his way after the man.

'Ah, here you are,' said Drumly when they met at the end of the room. 'I'm very glad to see you.'

Drumly grasped Ferrers' hand with such cordiality, and looked up at him with so simple an admiration, that the young man was touched with shame to think he was doing anything to deceive so frank and kindly a soul.

'Let us have a turn round,' said Drumly, taking Ferrers' arm: 'I can't move about much by myself.'

Ferrers had not seen Drumly on his feet before; and on looking down now, he perceived that one leg was shorter than the other, and that it ended in a stilted boot, with a sole six inches thick. Then the strong young man understood the pathos of the old man's admiration of Health, and he experienced an impulse of passionate desire to aid him with his health and strength; though—it at once occurred to him—it was absurd of a plain penniless soldier to think of being anything to a wealthy banker. He could at least, he thought, be honest and frank with the old man, and he came very near at that moment to saying: 'I understand you; I understand your admiration of me; but I don't deserve it! I am not the person you think I am! I am a fraud—an impostor!' Yet, he reflected,

why should he make a fuss? He had up till now done no harm to the old man, and he hoped he would do none; and to blurt out a confession could only mean disgrace and ruin to himself. These impulses and hesitations passed over him without leaving a shade on his face, which steadily beamed down on the old man with a tender and protective regard.

'I want to have a look at the cases with you,' said Drumly, smiling up at him; while Ferrers wondered that so ugly a gorilla face could look so pleasant. 'I call this a Health Conversazione, you know. That's why I asked you; you ought to be set up on a pedestal as the full expression of the whole thing.'

'And are these things,' asked Ferrers, beginning to look at the contents of the cases, 'supposed to be the food I've been brought up on?'

'Not exactly—not exactly,' said Drumly; 'or, at least, not directly. You've been fed on beef and bread and such-like, and bread is from wheat, and beef is grass wonderfully worked up.'

'And turnips and hay and chopped straw—oh yes,' said Ferrers.

'You know something of farming, then?' said Drumly, looking at him with fresh interest.

'A good deal,' said Ferrers, forgetting for the moment his rôle of Will Dawlish. 'I could take over the management of a farm to-morrow and work it, I think, at a profit.'

'Bless me!' exclaimed Drumly, stopping to look at him. 'You're quite accomplished! But how on earth did you learn farming to that extent?'

'Oh, I picked it up here and there.'

'Well, really,' said Drumly, 'if you're so good at it, you'd better get Sir William to let you manage the estate, now that you've come home: it needs you, I believe.'

That was all the allusion he made to family matters; but they continued to talk of grain and pulse (Drumly was anxious to know if Egyptian lentils could be grown in England); and the more they talked the more they were manifestly drawn to each other by the warmth of a mutual regard.

Dolly and Ferrers did not meet again that day; but they met the next and the next. Ferrers, however, could make no approach to Dolly, for Sir William's or Miss Dawlish's watchful eye was ever on him. Why did Sir William think it of so much consequence that he should not speak to her?

Of course, those who have known much of the ways of young men and young women will at once perceive that of all methods that was about the best to make these two young people wish to be near each other. Ferrers, who could not be blind to the fact that Dolly approved of him, was chafing to be near her; and Dolly's wistful glances and melancholy face told plainly that she was longing to have her cousin by her side. Ferrers never troubled to consider whether honour or anything of that sort forbade him to think of Dolly: what man when really involved has ever taken such matters into his consideration?

Now, if it had been a case in which he was merely a spectator, Sir William would have seen what was likely to occur as quickly as any one;

but since it was a case in which he was prejudiced and wrapped up, he did not see it; and therefore it happened that things fell out as they did.

The day soon came of which Dolly had forewarned Ferrers, when all the people concerned in this mysterious business were to assemble at Dawlish Place, Sir William's 'seat' in Surrey.

'Ferrers,' said Sir William one morning, 'it is just about the end of the season; perhaps you don't know that?'

'Oh yes,' said Ferrers; 'I know that.'

'Very well. Before people have the excuse that they are off to-morrow or the day after to the Continent or to Scotland, I'm going to have a little party down for a week to Dawlish Place. I'm asking Drew and Drumly down, and you must come. I tell you now in confidence that the business I engaged you for is coming to a head. You've done very well so far. We've skirmished up till now,' said he with a grin. 'Now, we're going to carry the enemy's position by assault.'

'The enemy, I suppose,' said Ferrers, 'being Mr Drew and Mr Drumly?'

'The enemy—on the whole—being Drew and Drumly.'

'Very well,' said Ferrers. 'I'm ready to march. When do we go, may I ask?'

'This afternoon; by the 4.30 from Waterloo.'

Ferrers rather 'funked'—I use the word he would have used himself—the visit to Dawlish Place. It was one thing to see 'swell' people for an hour or two now and then; it was quite another to spend a week constantly in their company. He doubted if he could fulfil the requirements of his position. After breakfast he went to seek Lord Debrett, to get from him comfort and advice.

'Ah, Dawlish,' said he, 'how are you getting on?'

'Oh, all right,' said Ferrers. When the man who had shown him in had withdrawn, he continued: 'It makes me jump to hear myself called by that name.'

'I couldn't help it before my man,' said Debrett.

'I wish I were well out of this business,' said Ferrers.

'Hallo! What's up?'

'I don't like Sir William, and I like Mr Drumly; and if there's any harm meant against Drumly, I'll have to go against Sir William, though I'm in his pay.'

'But why,' asked Debrett, 'do you think he means harm to old Drumly? I expect Dawlish wants to get at his late brother's property—for Miss Dawlish, very likely: you remember he said it was all for the sake of a lady. Perhaps she is being kept out of her rights.'

'Drumly's not the man,' said Ferrers, 'to keep anybody out of his rights. The fact is I don't trust Sir William. I'm in a funk about the whole business.'

'That's bad. It's not like you to funk anything.'

'I'm always in a funk before an action.'

'Is there an action coming, then?'

'Don't you know? Drew, Drumly, and lots of other people, I suppose, are going down to Dawlish Place to-day; and I'm going, and Sir

William says that will bring his business to a head.'

'The deuce it will !'

'You're going down, I suppose?' asked Ferrers.

'Well, I've been asked,' said Debrett; 'but I thought I wouldn't bother.'

'Oh, don't say that !' exclaimed Ferrers. 'I've been depending on you to back me up. It may be my last action, Debrett, and I hope you'll stand by me.'

'All right, old chap,' said Lord Debrett; 'since you put it like that, I will. I'll come down to-morrow.'

'Come down to-day,' urged Ferrers. 'We take the 4.30 from Waterloo.'

'Very well; to-day be it. Though I must break an engagement. I won't promise to take that train; but I'll come down to-night in time for dinner, if possible.'

'Thanks, very much,' said Ferrers. 'There's another thing. D'you think I must buy some special sort of togs to take down with me—shooting togs, for instance?'

'There'll be no shooting,' said Debrett. 'But I'll bring down things with me; and my things always suit you, you know.'

So it came to pass that Ferrers went to Waterloo with Sir William, fortified with the hope of meeting Lord Debrett there; or, if not that, of seeing him appear at Dawlish Place by the following train.

BRICK TEA.

EVERY reader of books of Eastern travel is familiar with the name of Brick Tea, but few writers have taken the trouble to explain, even in the roughest manner, what is the actual character of the commodity, and still less how it is made. It is, as yet, a peculiarly Chinese manufacture, although if our Indian planters obtain the access into the markets of Tibet for which they are longing, it will have to become a regular product in the gardens of Assam and Cachar, although possibly not in Ceylon, as the consuming markets are in Central Asia.

In a former article we explained the differences in the processes of tea manufacture in China and in India (see 'The Revolution in Tea,' *Journal*, Aug. 10, 1889), and showed how the falling-off in favour of the Chinese tea in Europe is chiefly due to the carelessness with which it is prepared for market. There is more than carelessness, however, in China—there is also fraud in packing, and 'Lie Tea' is a known article of commerce in some parts of China. Now, Lie Tea goes to the making of Brick Tea for the Tibetan, which is the principal, market.

The area on which tea is grown for this special purpose is an extensive one in the western provinces, of which Yung-ching may be called the centre; but the plant is a very different one from the carefully cultivated bushes of Eastern China, from which European tea is made. For one thing, the Yung-ching plant is allowed to grow much higher—often to fifteen feet—and it has a large and coarse leaf, two to two and a half inches long. The best Brick Tea is made in gardens where these trees are planted in rows

and kept in fair order; but, according to Mr Colborne Baber, the larger portion of tea for Tibet is supplied from bushes which are allowed to grow pretty much at their own sweet will along the borders of the fields and on the hill-sides—in fact, from half-wild plants. In the fourth year these trees begin to yield, and they continue productive for many years. In June, the pickings begin. There is, first, the young upper leaves, which the Chinese keep for themselves; second, the leaves of young plants; and third, everything that can be stripped from the trees, including twigs and sticks. It is the last picking which is usually turned into 'bricks.'

This is the process of manufacture. The leaves and twigs, after being sun-dried, are put into a cloth and suspended over a boiler to be steamed. Meanwhile, the mould is got ready, consisting of four short boards set up on end and securely fastened, with an internal space of about nine inches by three and a half inches. Within this cavity is placed a woven mat-basket, and into this the softened leaves and twigs are dropped in small handfuls, with a little rice-water to cause the mass to adhere. As layer after layer is added, the stuff is compressed by powerful blows from an iron-shod rammer. Next the coarser twigs are dried and ground to powder, and sprinkled over the other mass, or between the layers, so as to become welded in. The flexible basket round the tea prevents the mass from taking too angular a shape, as sharp corners on the bricks would make them awkward to carry on the long journey they have to perform.

After the mould is filled and sufficiently compressed, it is taken to pieces, and the cake, still within the mat, or basket, is taken again to the fire to be thoroughly dried. Then the ends of the mat are drawn together and closed up, and the *pao*, or cake, is ready for transport to Ta-chien-lu, where it undergoes further preparation. It should be mentioned that the cakes are weighed after being steamed, and are sold on that weight, although they lose about a third after being dried. At Ta-chien-lu they are cut into uniform sizes and repacked as *chuan*, or bricks.

The best kind of Brick Tea, such as is meant for the Russian market, is more carefully prepared. The choice leaves only are taken, and are spread in the sun until slightly withered. They are then rolled in the hand until they become moist with exudation, and pressed into small balls, which are left to ferment. When fermentation begins, they are ready for the moulds, and the process is pretty much as above described, but without the admixture of the twig-dust.

From Yung-ching and the other places of manufacture, the tea is carried either by porters or on mules to Ta-chien-lu, a distance of from one to two hundred miles, over two mountain passes seven thousand feet high. A man will carry from eight to twelve *paos* on his back all the distance—a weight of from one hundred and fifty to two hundred pounds, sometimes a good deal more, and over terrible heights where every step must be picked. The journey will take a porter about twenty days, and a mule about half the time; but the mule can carry only half as much as the porter.

A brick should weigh sixty Chinese ounces; but even the better quality seldom exceeds fifty-five ounces, while the common quality usually weighs in transport from forty to forty-five ounces. Thus the number of bricks transported hardly affords a fair test of the actual quantity; but it is computed that the annual export of Brick Tea from Western China to Tibet is not less than twelve million English pounds. This seems an enormous quantity; but it is to be remarked that, to the Tibetans, tea is an absolute necessity, not a luxury. They drink it at all hours, and without it grow restless, discontented, and unhappy. It is not cheap, however, as the Lamas keep the retail trade in their own hands. The selling price ranges from about sixpence to two or three shillings per pound, according to the distance from the tea-route; but the Lamas will, it is said, often exact in payment labour and produce from the people, who have no choice of markets.

This is how the Brick Tea is used in Tibet. The teapot is something like a butter-churn, into which a portion of the brick is thrown. After boiling, the infusion is passed through a strainer, and a little salt is added, after which the churn is stirred some twenty times. Then a lump of butter is added, and the churning repeated for some hundred or hundred and fifty turns. The tea is then ready for drinking, but of course has little or no resemblance to the fragrant and cheerful cup sacred to English 'Five o'clocks;' or even to the less fragrant and more astringent beverage with which too many working-women, and men also, injure their nerves and their stomachs. But astringency is what the Tibetan covets, and he would not thank you for a cup of choice Pekoe. The taste of the Tibetan infusion has been humorously likened by Mr Colborne Baber to something like weak English tea with rich milk but without any sugar or tea. The tea-principle is there, affecting the flavour of the butter and water, but not giving the taste of tea.

How highly this trashy compound is prized in the Land of the Lamas, however, may be inferred from the fact that not very long ago, and before rupees became comparatively abundant, tea-bricks were used as currency. Even yet, it is said, in some parts of the country a brick of tea is not merely worth a rupee, but is used as a rupee for purposes of trade and without regard to weight. This practice, however, has not been without its retributive side. The Lamas of Batang had stored up a vast quantity of tea-bricks as reserve treasure, regarding each brick as equal to a rupee. But when the Indian money began to circulate, and the Lamas wanted to convert their tea-money into silver, they found they could only do so at a loss of nearly forty per cent. Hoarding does not always pay, and one does not pity the monks, who had been exacting the uttermost anna out of the people for their indispensable tea.

The Indian rupee, it should be said, began to find its way in quantity into Tibet about five-and-twenty years ago, and is now fairly abundant there. The Russian silver rouble is said to be current also, and the circulation of these coins has done a great deal to break down the Lamas' monopoly of tea.

To come back to Ta-chien-lu, where the bricks pass into Tibetan hands. They are there wrapped in skins and carried in pack-saddles to Batang. These are curious and ingenious contrivances. Two light boards about fourteen inches long, thickly padded with cloth and felt, are connected by two wooden bows, and secured to a wooden crupper. From the bows hang loops of hide in which the packages are suspended, in such a way that if the burden strikes any obstacle in a dangerous pass, the package becomes detached and rolls away without overbalancing the animal. Horses, mules, and yaks are used for conveying the tea to Batang, where is the great depôt and centre of the domestic trade.

To reach Batang from Assam our Indian tea would have to cross the Patkoi Hills to Burma, thence into Yun-nan, and so northward again by Weisee, a distance of seven hundred and fifty miles.

It is said that the cost of carriage alone would be more than the selling price of Chinese tea at Batang; but time, no doubt, would economise transit, and the Tibetans might be educated into paying a better price for better tea, if free-trade relations were only established between India and Tibet. It is certainly a tantalising thing to think that the largest tea-consumers in the world—for the Tibetans are believed to consume from half an ounce to one ounce of tea per head per day—should be so near our Indian tea gardens, and yet, for all trade purposes, as far off as the moon. Darjeeling is, by road, within a very few days' journey from Lhasa; and indeed Calcutta itself is as near, as the crow flies, to the capital of Tibet as Paris is to Berlin. And then one could offer the Tibetans genuine good, wholesome, fragrant tea, made into bricks if they like, but not made out of brushwood and rubbish. Meanwhile, the remarkable fact is that the best tea in the world goes to Russia; and the worst tea in the world is eagerly bought and voraciously consumed in Tibet. The Brick Tea of Asiatic Russia is delicious; the Brick Tea of exclusive Tibet is nauseous trash.

Before leaving the subject, some interesting and little-known varieties of tea encountered by Mr Baber may be mentioned. In the mountainous region of Kiating he discovered two remarkable varieties. The monks of Mount O-mi, or Mount O, use a plant which produces an infusion naturally sweet, and tasting, as brewed, just like coarse Congou with a large addition of brown sugar. This is natural tea-and-sugar. The plant is grown on the mountain-slopes near the monastery, and does not seem to be known elsewhere. The leaf is to all appearance just like that of an ordinary tea-leaf, and probably the saccharine essence may be due to the soil.

The other curiosity is a natural tea-and-milk. This is a wild plant, growing in an elevated region without cultivation, and yielding an infusion which tastes just like tea and milk, without sugar, or perhaps more like tea and butter. This plant is found in an uninhabited region west of Kiating, at an elevation of six thousand feet and upwards, and in leafy shrubs about fifteen feet high. Not merely the leaf but the whole plant is used to make the infusion. Even the

wood when chopped up and boiled along with a few dried leaves yields a strongly-coloured tea, with much the same flavour as the Tibetans produce from their bricks and butter. Botanists may be able to explain these phenomena, and perhaps to classify the plants in some other family than the tea-plant.

THE TROUBLE AT GREAT BUCEPHALUS.

CHAPTER III.

THE morning dawned bright and clear; the sun lighted up such a tranquil scene at Great Bucephalus and the vast expanse of green prairie beyond; while the low hills which closed the view were so void and unmarked by any moving object, that it was hardly possible to believe that at any hour an awful danger might arise in such a quarter—that there could be any reason to dread the enactment of hideous scenes of bloodshed. Yet all those who had dwelt long on the frontier could have told how treacherous such calmness had proved ere now, and that, as they had to encounter the subtlety of the craftiest savages and the still worse scheming of renegade whites, delay might mean death.

It was plain that all the members of the newly-arrived party—save the children—had been told of the impending troubles; for the women were depressed and anxious in manner; their eyes were red with weeping; and at the slightest sound they started and cast a frightened look to the door. Under such auspices the early breakfast could hardly be a cheerful meal; for although Boytell and, in a much greater degree, Eltran made a show of hilarity, there was a hollowness in these efforts, which, instead of raising the spirits of the group, actually seemed to lower them; and this becoming more and more evident, the men abandoned their well-meant attempts, and the meal proceeded in almost total silence.

At its conclusion, the cries of teamsters could be heard outside; then Phil Trayle presented himself, and then some wagons and mules drew up before the house. Phil greeted the party in his usual frank way, and added, that if all was ready, they had better take the trip at once, as the mules were fresh, and the day splendid—'right pretty' were the exact words he used—for a ride. He said this with a smile, speaking to the women; but as he ceased and turned his head, he continued to bestow a meaning look on Eltran, which the latter appeared to understand, for he rose from the table and said: 'Now, Mr Boytell! and Polly and Aggy, get yourselves ready, for we start right away.—See that the children do not stray out, as the teamsters will not wait any time, and all our fixings can be on board in a few minutes.'

The women left the rooms at this suggestion, as did Boytell, to see after their 'fixings'; and then Eltran said: 'Is there anything fresh?'

'Yes; too much,' returned Phil. 'Texas Abe, the pedlar, has come in, and he says that he saw horsemen on the plains beyond Wickerman's

ranch, and he is sure they were Indians. We can trust Abe, you know, and he is almost certain to be right, having lived in an Indian country so long.'

'That is a warning indeed,' returned Eltran. 'The sooner all the women and children are at Strapley's, the better.—But how we are to get away from there,' he added gloomily, 'is more than I or any one else can tell at present.'

'We shall be a large party, Squire—that is something,' said Phil; 'as nearly all our people propose to go in the first place to the Mills; and then we shall be guided by what we hear as to whether we shall go up or down the creek.'

Eltran returned a few words agreeing with this view; but his countenance did not gain in cheerfulness; and without further conversation, the men busied themselves in the preparations for the journey.

The loading was soon completed; and from the elevated ground in front of the house, similar preparations for departure could be seen in various parts of the city; it was a 'city' to the very last, and, moreover, there were a host of locations—another characteristic word—on the frontier of even lesser magnitude than Great Bucephalus which were so styled, although not one of the whole had a shadow of a municipality.

Everything that travelled upon wheels appeared to have been put in requisition. Some of the 'outfits' would at another time have been mirth-provoking; but there was no disposition to laugh now on the part of any of the citizens, who, in the midst of their hurried loading, threw many troubled glances to the north-western horizon, the quarter from which danger was most likely to come.

Phil was very attentive to the comfort of the women and children, who were all stowed in one wagon. In the midst of their trouble, Mrs Boytell could not repress a smile to see how especially anxious he was that Miss Agatha should not be inconvenienced.

Several wagons, or groups of wagons, besides their own would leave Great Bucephalus in the course of the morning; but their own expedition was much in advance of the others, so they saw nothing of them. Indeed, even if bound for the same goal, these others might not have followed the exact track taken by the Eltran party—not a wonderful matter where no regular highway existed, and nearly all the open country served for roads. At anyrate, they had no company.

With all their desire to set a good example, and to appear perfectly at their ease, neither Eltran nor Phil could avoid frequent and anxious glances across the prairie. All remained clear and quiet there; but despite the endeavours of the men to conceal their anxiety, their companions took the alarm, and were in dread lest at any moment the hateful figures of the Indian warriors should come in sight.

Presently the party came to a spot where the road—so to call it, it was the usual track to a ford on the way to Strapley's Mills—sank rather abruptly. There were two or three of these descents ere the river level was reached, and some extra care to the teams was needed just there. For the first time in the short journey, the attention of the men was so concentrated on the mules

that they saw nothing ahead or around them. The view in this latter respect was limited by the swelling mounds which arose on either hand, as the track sank lower, when, at the most critical part of the descent, they were surprised by a shout almost close to them, and by a hoarse voice exclaiming: 'Go slow, Squire! You won't need to take all this slope to-day.' As much in alarm as in astonishment, they looked round, and saw two mounted men, each clad in the orthodox buckskin and slouched hat of the frontiersman, and who had either been hidden behind a spur of the banks, or their approach on the soft ground had been unheard.

'Why, it is'—began Eltran, but paused: the foremost of the men finished the speech—'Doby Rube, you mean,' said he; 'and you are right, Squire.—You need not move your pistol forward, Phil Trayle,' continued the speaker, whose quick eye had noted the action; 'there will be no shooting here. Anyhow, it will be bad for you and the ladies if you do fire.'

It was easy to see that Eltran and Trayle were much disturbed by the sudden appearance of this man. This was not to be wondered at; for the latter, at anyrate, and Great Bucephalus opinion in general, regarded 'Doby Rube as the absolutely worst, and certainly the most dreaded, of all the 'scallywags' and outcasts of whom Phil had spoken on the previous night. The new English arrivals did not know his history, and there was no time to tell them now. It would not have cheered them to hear that this man was a notorious ruffian; that he would be hanged by lynch law in any town on the frontier, and that beyond all doubt he was in league with the Indians.

'We must talk fast,' resumed Rube, after a pause. He was evidently the leader of the pair, for his companion did not attempt to speak. 'You are going to Strapley's Mills?'

'We are,' said Phil firmly; he felt that there was no use in trying to evade an answer.

'Well, you will never get there—by this road,' continued Rube; 'and if you want to keep out of trouble, you will not go anigh the Mills.—Go to Prairie Dog Ford, and make your way to Divide City.'

'What for?' exclaimed Trayle, who seemed to be the recognised spokesman of the party. 'Strapley's Mills are stone-built, and can stand a siege; while Divide is little better than a heap of wooden shanties, and is in the heart of the Injun raid.'

'It was,' said the horseman gravely; 'but the city will not be troubled by Injuns again. I can't stay to preach here. Take my advice, or don't take it. You will soon find out the reason why it was given, if you slight it.'

'But then you are'—Phil began, but checked himself, as he was about to say something terribly uncomplimentary.

Rube grinned sardonically, as though he fully understood the reason of this hesitation. 'I am a loafer, and the Vigilantes want me, and I should be all the better for a stringing up, you mean,' he continued. 'That is all true; but a better man than me would not have any influence with the Injuns; and bad as I am, I may yet like to pay back a good turn.—Ask madam there,' he said, suddenly changing his tone, and looking at Mrs Eltran—'ask her if she will believe me;

and if she thinks 'Doby Rube will ever betray the people who gave a home to his little sick girl, when every door was shut against her, and her father was hunted from post to post by the Vigilantes.'

'No, Rube; I am sure you may be trusted!' exclaimed Mrs Eltran, speaking for the first time. 'You may have been a bad man; but I believe you now, and beg my husband to trust you.'

'Thank you, madam,' said Rube. 'He will never regret it.—My time is up; but on leaving you, let me say that you must not suppose I should have been allowed to give this warning to any outfit but that of Squire Eltran. I know Injuns are said to have no gratitude, no friendship; any other team but this will find reason, between this hollow and Strapley's Mills, for thinking differently.—Now mind, Squire Eltran, and more especially you, Squire Trayle, don't turn back for anything you may see or hear, and go nowhere but to Divide City. And if you hear that 'Doby Rube has paid off some of the debts he owed in Great Bucephalus, remember, also, that he has paid the debt he owed for his little Minnie.' With this too easily understood speech, and without further leave-taking, beyond raising his slouch hat to 'Madam' Eltran, who was evidently in his mind the principal personage in the party, the outlaw rode off, followed by his silent but equally evil-looking companion.

There was a natural pause of doubt and uncertainty with the party as they watched the horsemen disappear; then Eltran, drawing a long breath, which was almost a sigh, said: 'Well, now, what are we to do about it? Adobe Rube is one of the very worst characters in the territory; yet I don't think he would wish to do me harm, anyway'—

'I should say, take no notice of what such a renegade cuss says!' exclaimed Phil Trayle, as his friend paused. 'He does not want us all to get to Strapley's, because we should be safe there, and there would then be no plunder for him and his thieving, murdering Injuns; though I believe him to be a worse man than any redskin in the tribes.'

This very decided opinion would probably have determined the unsettled opinion of Eltran. Boytell of course was hardly able to form a judgment on the matter; he only knew that their situation appeared to be one of extreme peril, and he felt an agonising anxiety on behalf of the helpless women and children who were under his care.

But the three women at once broke out into opposition to Phil's utterance. The two strangers had none of Boytell's doubt or self-distrust; they were quite as emphatic as Mrs Eltran, and all three declared they would trust the outcast Rube.

'I know he is a renegade and a horse-thief,' continued Mrs Eltran; 'I believe, too, he has been a homicide and a fire-raiser, like many other scallywags; but he may have the feelings of a father all the same for that. We know if 'Doby Rube loved anything on earth, it was his little Minnie. While she was with us, we had no trouble in Bucephalus with the Indians. That was through Rube, I am sure; and I am sure, too, he will never forget our kindness to the poor child.—I will not go to Strapley's Mills.'

Trayle and Eltran exchanged a queer look and a smile, which showed that they felt all opposition was hopeless after this speech. The mules were started again; and the little procession turned off at the point indicated—a mere depression in the bank, sometimes used as a pass to the more distant ford, but not often, as the ground beyond was bad for a good way, while a more direct route to Divide City was to be found by crossing the Three Water Ford, which had been just ahead of them.

This they were now forbidden to do; and as they turned through the pass, the men glanced anxiously round, to see if any trace of an ambush or of lurking watchers could be discovered. All was silent and blank; the monotonous green of the banks and the prairie—where its boundless stretch was visible beyond—was as lonely and unbroken by any living figure as if the foot of man had never trodden there. Yet it was certain that behind these green mounds the two outcasts were in hiding; almost as certain also—and this reflection caused the shudder which neither of the more experienced men could quite repress—that with them, and, like them, furtively watching, as beasts of prey could watch, were their still more loathed, although, perhaps, not more dangerous allies, the hostile red men.

Familiar as were Eltran and Trayle with the incidents of border warfare, they had no real belief in the truce which the 'worst cuss' of all, the outcast whites, had offered them; and it is no discredit to their manhood to say that their hearts sank as they guided the teams over the treacherous ground, where the indented banks might conceal a hundred barbarians, as the two men verily believed was the case. Their inexperienced companion, Boytell, felt uneasy enough at the turn events were taking, dreading trouble ahead, and the still further unsettling of his plans; but he believed all he had heard from Adobe Rube, and dreamt of no immediate danger on the way.

Slowly the trusty mules drew the wagons over the broken and uncertain ground of the pass. Brief as the passage really was, it seemed almost interminable to the two conductors; but at last the dangerous spot was cleared, and they moved more briskly along the open prairie, where at least they would see any foes who might assail them, and no ambush need be dreaded. Nevertheless, the ground was sufficiently rough to make their progress comparatively slow; and the eyes of the leaders were often turned to the treacherous hollow and broken high ground behind them; but all was silent and quiet there as yet.

They—Eltran and Trayle—were taking what they thought would be a farewell look at the ravine they had recently traversed, and were straining their eyes vainly to detect some signs of life in or about it, when exclamations of alarm from the women and Boytell simultaneously startled them. There was some cause for alarm, too, for just in front of them, ascending from a dip which had not been noticed, and was indeed scarcely to be distinguished from the ordinary level of the prairie, a group of Indians were close upon them. These were nearly all squaws, many of them with children—'papooses'—some mere infants, slung at their backs; some

older, and riding before or behind the mothers. The squaws—more cruel and unsparing, if that be possible, than the men themselves—exchanged looks of triumph as they approached the little party, uttering some guttural ejaculations, and significantly fingering the ugly knives which they all carried, even as did their lords and masters. The savages, either in obedience to some muttered word of command, or as a regular procedure in such cases, spread themselves, and evidently intended to come down on both sides of the wagons.

'Get your revolver out, Boytell,' said Trayle. 'I am afraid we shall have to fight our way. I only hope we can do it, for'—He hesitated here; but his glance at the women and children in the wagon spoke as plainly as any language. 'The chances are against us,' he continued, and his voice grew hoarser as he spoke; 'for on the right hand you see there are warriors; yet bad and devilish as they are, I would rather we should face a hundred of them, than fall alive into the hands of the squaws.—Be ready; here come the men.' But he was wrong; the warriors—the 'braves' of the troop—were indeed spurting to the front; but in lieu of preparing their bows or their revolvers for the fight, they waved their hands in friendly token, uttering the deep guttural 'Hou!' the regular Indian greeting of amity, as they did so, and then the welcome Spanish 'Bueno! Bueno!' followed.

One or two turned aside to say something to the squaws; it was brief, and utterly unintelligible to the listening whites; but the ferocious scowls of the warriors, and the frightened air with which the squaws drew back, left no doubt as to its import. The braves came alongside the wagons, and commenced a general hand-shaking with the passengers, declaring in their corrupted Spanish—which Trayle fortunately understood pretty well—their friendship for Senor Eltran and for Senora Eltran also; how no good Indians would harm them nor their *amigos*—their friends. With this speech there were mingled also some brief references to Senor Adobe Rube, *mucho brave hombre*—a great fighting man; which showed that the outlaw had indeed used his influence beforehand in their behalf.

This was of course highly satisfactory to the travellers, who nevertheless wished the interview ended; but knew not how, without offence, to close it, when suddenly the noise, not to be mistaken, of distant firing was heard, followed by several more reports in quick succession. Every eye was turned towards the pass recently traversed by the wagons, and to the ford at Three Water Creek. A few wreaths of smoke could just be distinguished rising above the mounds, and the white men shuddered to think what might be passing in that lonely hollow.

Not so with their new friends: at the sound of the firing, the expression of every face changed, squaws and warriors alike; then waving their hands in a hasty adieu, the braves set off at full speed towards the ford, uttering a whoop as they did so, so savage and fiendish as to curdle the blood of the trembling women who heard it. But even the terror inspired by this was not worse than that arising from the cruel grins and grimaces of the squaws, as they rode after their

lords, and pointed exultingly to what they hoped would be a scene of revenge and plunder.

The Indians have indeed bettered the instruction which their treatment by the whites has given them.

APPEALS AGAINST HUMAN INJUSTICE.

THE right of might has often enough perverted justice; and those who have misused their power and their office to obtain the condemnation of the innocent have been brand-marked by history. When the weak has been overborne by the strong, in the consciousness of his innocence, he has in certain cases appealed from the unrighteous judgment of the human judge to the righteous Judge of all the earth.

That such appeals should be made was in fact encouraged by the practice in the middle ages of submitting doubtful cases to the judgment of Heaven. Trial by ordeal was nothing else but this. When two men appeared before the judge, and one swore one thing and the other swore the exact opposite, the judge remitted the case to the Judge of all the world, and bade them fight the matter out, in full confidence that victory would be on the side of the innocent. The ordeal of plunging the arm in boiling oil, or of walking over red-hot ploughshares, was also an appeal to God. Cunegunda, the wife of the Emperor Henry II., was charged—so ran the legend—with infidelity, and was forced to prove her innocence by walking barefoot over red-hot ploughshares. The story is not historically substantiated; but it is quite certain that such ordeals were undergone, and they were a direct appeal to the judgment of Heaven.

There were many ways in which the decision of Heaven was arrived at. Richardis, wife of Charles the Fat, had to prove her innocence by walking in a waxed linen dress between two blazing piles of logs. Another form was that of plucking a ring from out of a caldron of boiling water. Another was the cold-water ordeal. Another form was to offer blessed bread to the accused, who said: 'If I be guilty, may this bit of bread choke me.'

Unhappily, with the abolition of the ordeal, in place of it in all European lands, save England, came the use of torture for the extraction of a confession. The fact of appeal to Heaven to give right judgment being acknowledged in Europe, naturally gave occasion to those who had been wrongly sentenced to appeal away from their unjust judges to the highest Court of all, that in heaven.

In 624 sat the Council of Macon, before which, Eustace, Abbot of Luxeuil, was summoned by one Agrestin, a former monk of Luxeuil, who charged him with observing certain peculiarities which had come from Ireland with the founder, St Columbanus, and were indeed common to the Celtic churches, but which Agrestin considered as schismatical, because contrary to Roman usage. The gentle Eustace explained that he followed the customs of the founder, and justified the

usage of Luxeuil; but as Agrestin always returned to the charge, and the bishops in conclave seemed dubious how to decide, he exclaimed: 'In the presence of these bishops, I, the disciple and successor of him whose institute you despise, cite you to appear, within a year, along with Columbanus, at the Divine tribunal, to plead the case against him there.' The solemnity of this appeal awed the prelates who leaned to the Roman usage, and they urged Agrestin to be reconciled to his former abbot; and the latter, who was gentleness itself, offered him the kiss of peace. But Agrestin refused it. Before the end of the year he was slain by the blow of an axe by a serf in an ignoble brawl.

Robert Grostête, Bishop of Lincoln, had many a struggle with Pope Innocent IV. against papal encroachments on the rights of his see. According to Knyghton, the old chronicler, a year after his death he appeared to the Pope and called to him: 'Stand up, wretched one, and come to judgment!' As the Pope hesitated, he raised his pastoral crosier and struck Innocent on the breast so that he died on the following day, December 7, 1254.

At the opening of the thirteenth century, Absalom was Archbishop of Lund, in Sweden. There was a tract of land held by the church of Lund in conjunction with a wealthy bonder, and as much controversy and quarrel arose from the double rights, the Archbishop asked the bonder to divide the land equally between him and the see. The bonder, weary of the strife, consented. The Archbishop and he proceeded one summer day to measure out and parcel the land in dispute. As Absalom would trust none but himself, he held one end of the rope, and bade the bonder hold the other. Whilst thus engaged, he shouted to the other to pull harder and stir his stumps, as they had a long day's work before them. The bonder, nettled, tugged at the rope and jerked the Archbishop off his feet, so that he fell backwards on some stones and cut his head. Absalom, in a great rage, declared that the bonder had rendered himself liable to excommunication, and that he would be placed under papal ban unless he put his case unreservedly into his hands. The farmer, finding himself powerless to resist, did so, when Absalom condemned him to surrender to the church his portion of the coveted estate. The bonder was thus reduced from the position of a wealthy man to one of small means. The vexation preyed on his mind, and he fell ill. Finding himself dying, he sent for a priest, and promised him his best horse and saddle and bridle if he would ride, the moment the breath was out of his body, to Lund and summon Archbishop Absalom before the throne of God to answer for the injustice done him. The priest did as required. On the 21st of March 1201, he appeared before the Archbishop and pronounced his summons. At once Absalom turned deadly pale, fell out of his seat, and was taken up dead.

Ferdinand IV., king of Castile, is said to have been summoned within thirty days to answer before the heavenly Judge for a wrong he had done; and he died on the thirtieth day.

The Bishop of Sénez was preaching before Louis XV., and took for his text, 'Yet forty days, and Nineveh shall be overthrown.' He gave such a pointed account of the vices of the godless city

and its king, that the whole court thrilled with uneasiness, believing he was warning the king, and when he concluded with a significant gesture and hand outstretched towards Louis XV., 'Yet forty days—and then overthrow,' it was taken as a denunciation of and warning to the king. Within the time specified Louis XV. was no more, May 10, 1774.

No more infamous a perversion of justice probably ever occurred than the condemnation of the Templars, whose wealth and power made them feared by the king of France; and the Pope, Clement V., surrendered the unhappy Order to the French king. Du Molay, grandmaster, was burnt alive. As he mounted the funeral pyre, in a clear calm voice, he declared: 'Before heaven and earth, on the verge of death, where the least falsehood bears like lead upon the soul, I protest that our sole guilt has been that we trusted the seductive words of the Pope and the king.' Then he cried: 'Clement, iniquitous and cruel judge'—some accounts say he included Philip the Fair, the king—'I summon thee to meet me before the throne of God.' A year passed, and Clement and Philip were dead (1314).

An earlier story relates to the Council of Chalcedon (451), which condemned Dioscorus, sometime Bishop of Alexandria, for his Eutychianism. The monks had taken up eagerly the side of heresy, under one Barsumas. As they could not obtain recognition of the heresy by the Council, they fiercely shook their garments in contempt of the assembled fathers, and Barsumas loudly summoned Pulcheria, the Empress, whose influence had led to the assembly of the Council, to answer for it before the supreme Judge. She died a few days after, and Barsumas at once took rank as a prophet among his followers.

Jerome of Prague was sentenced by the Council of Constance to be burnt for his heresies. He appealed in loud tones 'To the sovereign Judge before whom you must all appear and answer for this judgment before a hundred years are passed.'

A great judicial crime was the condemnation and burning of Urban Grandier. The story of the possessed girls of Loudun, in France, in 1625 is well known. The nuns were poor; they hired a house and received boarders. Some of these boarders were of a frolicsome disposition, and frightened the nuns with strange noises and freaks that made them suppose the house was haunted. At this time there was at Loudun an eloquent young priest named Urban Grandier, who was an object of jealousy to the canons of St Croix, and they utilised the hauntings to effect his destruction. The nuns and girls became a prey to hysteria, and in convulsions declared they were possessed by devils sent to them by Grandier. On this accusation the unfortunate priest was condemned, and burnt alive. Before his death he solemnly cited his persecutor, the instigator of the whole infamous plot, to meet him before the throne of the Judge of all in the course of a month from that day; and exactly a month afterwards the man died.

Terence O'Brien was Bishop of Emly. When Limerick was besieged, Ireton, Cromwell's commander in Ireland (1651), sent him word that he would give him forty thousand pounds sterling, and permission to retire in safety, if he

would exhort the people to surrender. This the Bishop refused, and Ireton excepted the Bishop from amnesty; he proposed to the besieged to bring him the head of the prelate together with those of twenty men who had voted against surrender. If they would do this, he would spare the town. This was refused by the citizens. At length the city surrendered, and the Bishop fell into the hands of Ireton. The stern Puritan at once ordered the prelate to death. Bishop O'Brien turned to the General and said: 'I summon Ireton, the arch-persecutor, to appear in eight days to stand before the heavenly tribunal, to answer for his deeds of cruelty.' On the eighth day, Ireton, stricken with the plague, was a corpse.

In Gothland, a certain John Turson, who was innocent, was sentenced to death by a magistrate, offhand, seated on his horse. Turson protested his innocence, and summoned the judge to attend with him before the highest Judge. As Turson's head was struck off, the judge fell from his horse and broke his neck.

Meinwerk, Bishop of Paderborn, was abused by a certain monk with great violence and with many charges. The Bishop answered him: 'Well, let us appear together before the Judge of both, and let Him decide between us.' Singularly enough, the monk died on the same day (June 5, 1039) as did the Bishop.

One of the most horrible of the many crimes committed on both sides in the revolt of the Netherlands against Spanish rule was the execution of Nanning Koppezoorn, by the Dutch governor of Holland. 'He bore,' says Mr Motley, 'with perfect fortitude a series of incredible tortures; after which, with his body singed from head to heel, and his feet almost entirely flayed, he was left for six weeks to crawl about his dungeon on his knees. He was then brought back to the torture-room and again stretched on the rack, while a large vessel was placed inverted upon his naked body. A number of rats were introduced under this cover, and hot coals were heaped upon this vessel, till the rats, rendered furious by the heat, gnawed into the very bowels of the victim, in their agony to escape.' When finally led to execution, the Calvinist minister, 'Julian Epeszoorn, endeavoured by loud praying to drown his voice, that the people might not rise with indignation; and the dying prisoner with his last breath solemnly summoned this unworthy pastor to meet him within three days before the judgment-seat of God. It is a remarkable and authentic fact,' continues Mr Motley, 'that the clergyman thus summoned went home pensively from the place of execution, sickened immediately, and died upon the appointed day' (1575).

George I. had been divorced from his wife, Sophia Dorothea of Zelle, in 1694, and she remained in confinement for thirty-two years in the castle of Ahlen. She died on November 13, 1726. Before her death, she wrote a letter to George, denying the charges that had been made against her, and solemnly citing him to appear before God's throne and there answer for his conduct towards her. In June 1727 the English king arrived in Germany on his way to Hanover, as usual, when this letter was thrown in at the coach window, and fell on his lap. He tore it open, and was so alarmed—it is said—that he fell into a con-

vulsion and died. He certainly was attacked with apoplexy on the road, and was carried a corpse from his coach (June 11, 1727).

We will conclude with a story that seems to be thoroughly authenticated. In the church of Barlt, in Dithmarschen, were two pastors. The one, Wattenbach, was head-preacher; and a man of very broad views. Along with him, in 1691, was a deacon named Hoesch, a severely orthodox Lutheran. It seemed to the latter that the teaching of his superior sapped the foundations of Christianity, and he preached vehemently against his latitudinarian opinions. The parishioners sympathised with the head-preacher; and as Hoesch could not stir them up into zeal for orthodoxy, he laid a formal complaint against Wattenbach before the provost Hahn of Meldorf, who at once took the matter up; and a charge of heretical teaching was brought against Wattenbach in 1695 before the consistory at Rendsburg. The synod admonished both parties to peace. In 1699, Wattenbach was again summoned before the consistory, and was questioned as to his belief. He then admitted that he had indeed entertained rationalistic views, but declared that he had entirely abandoned them. The synod thereupon again dismissed the charge, and again exhorted to fraternal charity. In vain. Hoesch and the provost Hahn, finding that the ecclesiastical authorities would not condemn and deprive Wattenbach, appealed to the king of Denmark and Duke of Holstein-Glückstadt; and a government Commission deposed Wattenbach. This was made a grievance of by the ecclesiastical authorities, who, on the appeal of the accused, took the matter up, with the royal consent. Wattenbach was again acquitted, and Hoesch himself narrowly escaped suspension. A royal decree, dated October 26, 1700, confirmed the decision of the consistory. But this did not produce peace. The affair assumed another aspect, and Wattenbach was again accused before a royal court, not now of heresy, but of something connected with the quarrel, the particulars of which are not recorded. Judgment was given on April 1, 1703, and sentence of expulsion from his cure was pronounced against Wattenbach at Glückstadt. When the pastor heard this, he asked if there were any appeal possible. He was told that there was none. Then he solemnly said: 'I, John Caspar Wattenbach, refer my cause to Heaven. I cite the provost Hahn to appear this day twelve weeks, the Chancellor who has given judgment to appear this day fourteen weeks, and my prosecutor, the fiscal officer, at the same time, and all my witnesses who can testify to my innocence to attend within a year and a day before the Divine tribunal.' A death-like stillness fell on the court. It was broken at last by the Chancellor, who rebuked the accused, and condemned what he had done as a profane act, as he regarded it. Wattenbach replied that the sentence of the court destroyed his repute, cast him and his family into utter poverty, and deprived him and his of their home. Having no other redress, he was forced to make this appeal. He then thanked the judge for his well-meant rebuke, and withdrew. He returned to Barlt to clear his family and goods out of the parsonage, and died there sixteen days after the sentence, on Good-Friday, April 16, 1703.

On the 24th of June, the twelve weeks allotted to Provost Hahn had elapsed. It was Sunday, and, moreover, St John the Baptist's Day. The provost preached in the morning in the parish church of Meldorf on a passage from the gospel for the day, Luke i. 57-80. He felt perfectly well and in good spirits; and in the afternoon jokingly sent a message to the Chancellor to remind him that his time was up, but that no token appeared of anything being the matter with him. Before the messenger returned, he had fallen in an apoplectic fit and had breathed his last. Exactly on the day appointed, at the end of the fourteenth week, the judge also died, so also the prosecutor, on the same day; and within the twelvemonth every one of the witnesses summoned by Wattenbach to attest his innocence was dead.

This account was given by the provost Burckhard, who sat in the consistory before which Wattenbach had appeared, and he says that all who were mixed up in the matter could attest the truth of what he relates. The registers of the parish of Barlt certainly confirm some of the particulars. The son of Wattenbach became afterwards pastor at Colmar. That nervous terror may have in many cases worked the death of the men summoned is likely enough. Some of the stories recorded may have been invented *après coup*, but certainly not all.

A GENUINE TENIERS.

BY JOHN LEYS.

'For a genuine undoubted Teniers, I call it cheap, sir—very cheap indeed.' As Mr Jacob Goldstein, picture-dealer, picture-cleaner, and money-lender, made this little speech he dug his thumbs yet deeper into his waistcoat pockets, raised himself slightly on his heels, and glanced sideways at his customer. That gentleman, a tall lanky person, of perhaps fifty years of age, evidently an American, was bending himself at right angles before a dark-coloured canvas upon which he could at first discover no likeness to anything whatever. Patient investigation, however, disclosed the fact that there was a picture, though it was very indistinct—a picture of two youths, presumably students, drinking in an ale-house. A stout female figure—no doubt representing the landlady—stood at the other side of the table, a broad smile resting on her face; and her right hand still grasped the neck of a large wine-bottle which she had just placed on the table. What little light there was in the picture came from a casement to the left of the spectator.

'How much do you say?' asked the American, suddenly straightening his back and standing bolt upright.

'Six hundred and fifty, sir.'

'Three thousand two hundred and fifty dollars for that bit o' blackness! Thunder!'

'But for a genuine old master I assure you it is marvellously, amazingly cheap.'

'How old, now, do you suppose that picture may be?'

'Well, as you know, sir, there were two Tenierses, father and son. I should say, judging from the subject, that this is the work of the

younger man. That would bring us to the middle of the seventeenth century—say two hundred and fifty years back.'

'Hum! Not so very old, after all,' said Mr Hiram J. Bounder, the intending purchaser.

'There are older pictures in the world, no doubt,' returned the dealer, with a smile of superior knowledge; 'but where are they? Locked away in museums, or treasured up in private collections. How often does one of them come into the market? Not once in ten years. Copies may be had, of course. I don't deal in them myself. But for an undoubted Teniers this is surprisingly cheap.'

'I'll take it,' said the American. 'Send it to the *United Empire Hotel*.'

Mr Bounder expected that his artistic friends would go into raptures over his purchase. To his surprise and mortification, they were silent, uncritical, and unenthusiastic on the subject. At length a horrible doubt stole into his mind.

'Do you mean to say the thing ain't real?' cried Mr Bounder, speaking to a young painter who was looking at the canvas with slightly veiled contempt.

'If you mean, Is it a real picture?' returned his friend, 'it certainly is. If you mean, Did Teniers paint it? I reply, No more than I did.'

'But you can't be sure?'

'Yes, I can. If I'm not very much mistaken, I've seen the original of that very picture in a museum or town-hall somewhere in Belgium. Can't be sure where it was; but I'll look it up, if you like.'

'I wish you would. Then I'd make the beggar take it back.'

'I fear you won't,' said the artist with a smile.

'What!' cried the American, in a transport of rage. 'If I go into a shop and ask for a gold watch, and pay for it—pay for it, mind!—and the man, being a cheat and a scoundrel, palms off a gilt one on me, can't I make him take it back? Won't the law make him give me back my money?'

'I daresay. But with pictures it is different.'

'Why?'

'Because it is next to impossible to prove that the picture *is* only a copy.'

'It's nothing else than getting money by a false pretence!' cried the American.

'True; but you can't punish the dealer, because you can't prove that he knew it was a copy. You can try; but you'll only lose your money.'

Mr Bounder did pay another visit to Mr Goldstein's establishment; but the step produced no satisfactory result. The dealer was by turns indignant, sarcastic, and conciliatory.

Not genuine! 'The Topers' not a genuine Teniers! Who were the young gentlemen who had hazarded such an opinion? Mr Goldstein wanted very much to know. What did *they* know about pictures? They envied Mr Bounder the possession of a treasure for which they would give their eyes—if they had eyes, and were not as blind as so many moles. Another picture of the same name in Belgium? It wasn't at all likely that Mr Teniers would paint two pictures with the same name. If he did, they would be quite distinct in treatment. But the Belgian one was *like* this? Then it was a copy of Mr Bounder's picture. There could be no doubt about *that*.—

And in the long run Mr Hiram J. Bounder was thoroughly convinced that, whether the picture was genuine or not, the dealer would fight the matter out rather than refund a farthing of the price.

Some months had passed, and the incident just narrated had well-nigh faded from Mr Goldstein's mind, when one afternoon a dark man of foreign appearance, wearing an expensive fur-lined overcoat and an enormous moustache, walked into his picture-gallery.

'Do you clean pictures?' asked the stranger, with an air of hauteur which impressed the dealer most favourably.

'Certainly, sir,' said Goldstein, doubting whether he ought not to have said 'My lord.'

'Then I'll send you one along which I have just bought—a Rubens of considerable value. You will insure it and take the greatest care of it?'

'Of course, my lord.'

The title slipped out almost involuntarily.

'You may expect it in about an hour,' said the stranger, walking out of the shop.

'I beg your pardon,' said Goldstein, hastening after his customer; 'but what name shall I put down as the owner?'

The gentleman smiled slightly, as if in surprise that he had not been recognised, and pulling out his card-case, handed the picture-dealer a card.

'Count Olanoff,' said Goldstein to himself. 'I know him, by name at least. No chance of making anything out of *him*.' The Count's name was indeed well known as a picture-buyer of taste and experience.

In a short time the picture arrived, and very handsome it looked in its deep, rich, oval frame. 'The Music Lesson' was the title of the painting. The background was dark, almost black, but the foreground was comparatively in the light. Two young women of the burgher class were seated near a spinet, and were listening with an air of demure attention to their music-master, a stout, good-natured-looking man in a bob wig, who, resting his violin lightly on the table, was expounding some point connected with his art. The faces of the group were of the types familiar to those who are acquainted with the Flemish school of painting, but the accessories had been most carefully finished.

Not long after the picture had been deposited at Goldstein's gallery, its owner came into the shop, walking very rapidly, and inquired of the picture-dealer whether 'The Music Lesson' had been touched yet in any way. Fortunately, nothing had been done to it; and Count Olanoff, going out to the hansom which had brought him to the spot, conducted from the cab a gentleman whom Goldstein knew at once to be an American, and conducted him to the corner where 'The Music Lesson' was standing.

'There now!' exclaimed the Count, gazing at the picture with the eye of a connoisseur. 'Isn't that grand?'

From the scraps of conversation which the picture-dealer overheard as he stepped to and fro, he easily made out that the Count was trying to sell the picture to the American, and that the latter gentleman, while greatly admiring the specimen of medieval art before him, hesitated about paying the required price. And it was evident to Mr Goldstein that the Count was

a very poor hand at driving a bargain. The dealer's instincts prompted him strongly to interfere, and only his respect for the Count's rank prevented his offering a suggestion or two. He looked upon Americans as fair game, and became quite uneasy at seeing that this one was not going to be fleeced to any extent worth mentioning.

Eventually it was agreed that the intending purchaser should have a day or two in which he might consider the matter; and the two gentlemen walked out of the shop.

The Count returned a moment afterwards to express a wish that the picture should not be touched by cloth or sponge for the present, and added: 'By the way, I am going out of town for a few days. Could you see the gentleman who was here just now, Mr Spikeman, and arrange the terms of sale?'

'Delighted, my lord. And your lordship will excuse me for saying that I believe I shall be able to secure better terms than your lordship could possibly have done.'

'Ah, daresay, I *would* sell for two thousand; but I think I ought to get more.'

'Beg pardon, my lord, but did your lordship name a lowest price?'

'I don't think I named a lower sum than three thousand; but I doubt if the man will give much more than two. Commission as usual, you know.'

The picture-dealer bowed, and the owner of 'The Music Lesson' left the shop.

Two days afterwards, the American came to have another look at the picture; and Mr Goldstein at once explained that he had been constituted the Count's agent for its sale, adding that it was sure to fetch a high price. Mr Spikeman, a small, lean, round-shouldered man, who walked with a stoop, seemed surprised to hear that he was to have possible competitors, and stood contemplating the masterpiece, stroking, meanwhile, his jaw with the fingers of his right hand, as if he were feeling for a tooth that had somehow slipped out of its place.

'Guess I can afford to give you two thousand pounds for the picture,' said Mr Spikeman, after listening to a long dissertation on the merits of the painting.

'My—dear—sir!' ejaculated the dealer with a half-contemptuous smile, 'you might just as well offer me two thousand pence. I could get a dozen offers of two thousand eight hundred in half an hour; but the Count wants three thousand five hundred.'

'He told me I might have it for three thousand,' said Mr Spikeman in slow, deliberate tones, still caressing his jaw as he spoke.

'Well, sir, his lordship must have mentioned the sum in an unguarded moment, without thinking of what he was saying. But as his lordship *did* say so, of course I am bound by his offer. For three thousand pounds, sir, that noble picture is yours.'

Mr Spikeman, however, did not jump at this generous proposal. He wanted more time to think it over; and to this the dealer cheerfully consented.

The next time the American visited the shop Mr Goldstein brought his little devices into play; gentlemen who had apparently visited the

gallery on some other business stopped opposite 'The Music Lesson,' as if arrested by its beauty, and remained in rapt contemplation before it for a minute or two, and then went off, casting lingering looks behind, and observing to Mr Goldstein that pictures of that rank were far beyond the reach of *their* purses.

Sometimes, when Mr Spikeman came to see the painting, he would find a small group of men surrounding it, engaged in eagerly discussing its various beauties; and occasionally one of these admirers would be conducted by Mr Goldstein to a mysterious apartment partitioned off from the gallery at one end of it, presumably for the purpose of talking over a purchase. Stimulated, apparently, by what he saw and heard around him, Mr Spikeman offered two thousand two hundred, then three hundred—four, five, six, and finally eight hundred pounds over the two thousand. But Goldstein was convinced that the American would give three thousand pounds for the painting rather than lose the chance of securing a real Rubens; so he stood out for the higher sum.

In the meantime, however, a question had occurred to the picture-dealer, which had more than once occurred to him under similar circumstances. Since the Count was willing to sell 'The Music Lesson' for two thousand pounds, and Mr Spikeman was willing to give two thousand eight hundred, or possibly three thousand, why should not the difference between those limits belong to him, Jacob Goldstein, in its entirety? The thing could be done, and done with safety, if there was a tolerable certainty that buyer and seller would not meet after the transaction was completed. The picture-dealer put a question or two to Spikeman as to the extent of his acquaintance with Olanoff; and the American told him that he had merely met the Count in somebody's studio, and did not even know his address.

It seemed perfectly plain sailing; and when Count Olanoff called at the picture-gallery on his return to town, Goldstein had already made up his mind on the matter.

'I must set off for Italy to night,' said the Count, 'and I wish that sale completed at once. Have you struck a bargain yet?'

'Not yet, my lord. But Mr Spikeman promised to come and give me his answer this very afternoon,' answered Goldstein, fervently hoping that he would not arrive before the owner of 'The Music Lesson' was well out of the way.

'How much do you expect he will give? Three thousand?'

'Ah, no, my lord,' said the dealer, shaking his head sadly. 'If he gives two thousand two hundred that will be all.'

'Humph! Well, you won't part with my property without the money, of course. But I must call this afternoon and take away the picture if the sale is not effected to-day, you understand?'

'I quite understand, my lord.'

'I will call about four o'clock, then; and I don't much care whether the picture is sold or not. If it isn't, I must have it packed. I suppose it can be packed here?'

The picture-dealer bowed, inwardly resolving that there should be no need of any such packing; and the Count left the gallery.

It was a quarter to four before Mr Spikeman made his appearance; and Goldstein was on thorns lest the American and Olanoff should meet. In a few words he explained that if Mr Spikeman did not make up his mind now, he would for ever lose the chance of possessing a true and genuine Rubens.

'I'll give you two thousand nine hundred,' said the Yankee.

'I tried to get his lordship to say that very figure, and he wouldn't,' said Goldstein with a sigh. 'He won't part with it under three thousand. He told me if I couldn't get that price, to pack it, and the box is being got ready now.'

'Oh, well, I suppose I must give the three thousand,' drawled the American. 'I'll send along the cheque to-night.'

'But you see his lordship is leaving the country to-night. If you *could* favour me with a cheque now?'

'But I don't carry my cheque-book about with me, as you Londoners do. I have my purse here; but you can hardly expect that I should have three thousand pounds in it.'

'That need be no obstacle, sir,' said Goldstein, who was anxious to fix the bargain by a written document. 'Suppose you write me a cheque on half a sheet of note-paper, just to show to his lordship; and I can exchange it for a regular printed one in the morning, if you prefer it.'

This seemed reasonable enough; and in a minute or two the cheque, stamped with a postage-stamp, was made out, signed, and handed over. It was arranged that Mr Spikeman would send a regular cheque to be exchanged for it, and also send for the picture, on the following morning.

The American had only been gone about a quarter of an hour when the Count arrived.

'Well, have you sold the Rubens?' he asked hastily.

'Just sold it, my lord, for two thousand two hundred pounds,' said Goldstein.

'Ah! not a large price; but I suppose I mustn't grumble. Your commission will be a hundred and ten, I suppose? That leaves two thousand and ninety for me to get. I suppose the American gave you a cheque? I can take it, and pay you the commission separately.'

Of course Goldstein did not intend that the Count should see Spikeman's cheque showing that he had paid three thousand pounds for the picture, so he answered quickly: 'Very sorry, my lord, but I've just paid it in to my bankers. It would be too late to get it cashed now at anyrate, as it is past bank hours.'

'But I must have either the money or the picture.'

'Well, my lord, I will give you a cheque for the two thousand two hundred, less a hundred and ten commission,' said Goldstein; and turning aside, he wrote out the document.

Count Olanoff took it with some little hesitation; and the picture-dealer, noticing this, drew himself up. 'I should tell you, my lord,' he said, 'that I do a little banking on my own account. My signature would be honoured for a much larger sum than that.'

The Count nodded, muttered something about its being all right, placed the cheque in his pocket-book, and went away.

Next day, the picture-dealer waited until noon, but no messenger came from Mr Spikeman. A little uneasy at the delay, Mr Goldstein went himself to the Metropolitan Bank, on which the American's cheque was drawn, and presented it for payment.

The cashier took it, turned it this way and that, scrutinised it, smelt at it, and handed it to a brother-cashier. This official studied it in his turn, and finally handed it to a third, who carried it into the manager's room.

Mr Goldstein's heart sank within him, and his knees became as water, as he watched these ominous proceedings. Finally, the half-sheet of note-paper was tossed back to him across the counter with the words 'No account' scrawled over its surface.

The picture-dealer tottered to a seat. Then, reviving, he went out, summoned a hansom, and drove to his own bank. Yes; *his* cheque had been presented and cashed the first thing that morning by a man who must have been Count Olanoff's twin-brother, if not himself!

'Well, at anyrate I've got the Rubens, and I must sell it for the best price I can,' said Goldstein to himself as he went slowly back to his picture-gallery.

Having arrived there, he went up to 'The Music Lesson,' which was now practically his own property, and inspected it more narrowly than he had hitherto done. More than once, as he had passed in front of the painting, something about it had struck him in a vague way as being familiar to him. Now this feeling was stronger than ever. He was convinced that he had seen it before; but where? With a cry he darted forward and peered eagerly at the canvas; then he took out his penknife and began to scrape the paint away very gently and carefully. He soon found that there was a layer of fresh paint upon an older surface; and the new pigment being scraped away, Mr Goldstein brought to light—his 'genuine Teniers,' 'The Topers!' The students had been turned into young damsels, and the landlady into a fat music-master, by altering the features a little and adding appropriate garments; but the pose of the figures remained, of course, what it had been. The fireplace in the original picture had been turned into a spinet; and when the music-master's violin had been carefully obliterated, the old familiar black bottle of 'The Topers' once more greeted his vision.

It was plain that the whole thing—the visit of the Count, the introduction of Spikeman, his pretended reluctance to buy the picture, and the stratagem by which a valuable cheque had been obtained from him in exchange for a worthless one—had been carefully pre-arranged. There could not be much doubt as to the origin of the trick; but all uncertainty on the point disappeared when it was discovered that the words, 'With compliments—Hiram J. Bounder,' were written on the margin of the canvas.

The sight of this inscription made the Jew wild with rage; but he understood only too well that redress and revenge were alike unattainable. Spikeman was of course far beyond his reach; and in any case he could not hope to fight the matter out in a court of law without exposing his own misdeeds, and thus, as it were, cutting his own throat.

Certainly the picture-dealer never expected to set eyes again on any one concerned in this transaction; his surprise, therefore, was great when one day about three weeks after the departure of Mr Spikeman, Mr Bounder, followed by Count Olanoff and a stout pink-faced gentleman, walked into his picture-gallery.

'How are you?' said the American, going up to the astonished Jew and shaking him effusively by the hand. 'Got any more gen-u-ine Teni-erses on hand neow, eh?'

Mr Goldstein wrenched away his hand and scowled at the party from under his heavy eyebrows. 'No; but I know that I have been cheated most disgracefully by some of you "gentlemen"—and if there is law in England, I'll have my rights!' he added angrily.

The Count and the stranger stared at him coolly, while the American regarded him with a benevolent smile.

'You had a cheque from me for two thousand one hundred pounds!' he cried fiercely, turning on Count Olanoff.

'I had,' said the Italian quietly.

'And the purchaser of your picture was a cheat, a lie, a forger!' screamed the Jew. 'He gave me a cheque, but it was dishonoured. I have never had one penny of my money; and your picture turned out to be worthless!'

'You don't say so!' murmured Mr Bounder in a sympathetic tone.

'Yes; and I want my money back,' he said, striding up to the Count.

'Did I sell the picture to you?' asked the Italian with perfect composure; 'or in any way guarantee its genuineness? Did you not yourself offer to give me your cheque before the purchaser had paid you?'

Goldstein could not deny that it was so.

'Why don't you get the money from the other man?' put in the American.

'Because he was a thief! a rogue! a scoundrel!' cried Goldstein excitedly. 'He have no money, no account at the bank!'

'Say, now, what might the person's name be?' inquired Mr Bounder.

'I suppose you don't know,' sneered the Jew.

'Ef it might be Spikeman, he's a man I might bring to book,' said Mr Bounder in a reflective tone of voice. 'How much was the cheque for?' he added suddenly.

'Two thousand two hundred pounds,' answered Goldstein promptly.

'Really?' cried the Yankee with assumed indignation. 'Give me the cheque, and I'll make him pay you, sir!'

'Oh, I didn't keep it; I burnt it,' said the picture-dealer.

'That's a pity, now; for I did hear—through the banker, let us say—of a cheque of Spikeman's that had been dishonoured; but it was for three thousand odds. Couldn't have been the same, of course.'

Goldstein eyed the American curiously, but said nothing.

'What have you done with the picture?' asked the Count sharply.

'The picture! It was a fraud, a cheat, a swindle!—There is the picture!' and quite forgetting in his rage that Mr Bounder had been the former owner of the painting, he dragged

aside a canvas or two which stood in front of it, and displayed 'The Topers' in all its deformity.

'Why, that's my Teniers!' exclaimed the American, putting his hands on his knees and bending down to examine it. 'Great Scott! how sing'lar!'

'I expect you know all about it!' growled the Jew.

'I know it's a genuine Teniers; you told me so yourself,' said Mr Bounder.

'Well, it ain't; that's all,' growled the picture-dealer.

'Oh, it ain't, eh? So you took me in, a simple-minded man like me! Wonder you ain't ashamed of yourself!—But I'll tell you what I'll do, mister,' added the American, after a pause—'I'll ask Count Olanoff to pay you back that two thousand one hundred he had of you'—

'Oh, sir!'

'On two conditions. First, you hand over that cheque for three thousand pounds—the one you burned, you know, or acknowledge that it *was* for that amount. Next, you write me a letter acknowledging that the picture you sold me was not genuine, and you apologise, and hand back what I paid you for it.'

'If I do that?'—

'You shall get back the rest of what you have lost.'

The offer was too tempting to be refused. The required letter was written and signed; Spikeman's cheque for three thousand pounds was found and handed over; and the Jew was repaid the two thousand one hundred pounds, out of which he handed six hundred and fifty, the original price of 'The Topers,' to the American.

'You'll acknowledge that I've got the money back and won my bet, my lord?' said that astute person to the pinky-faced gentleman.

'Fairly won, by George!' said the stranger.

'It wasn't so much the dollars,' said Mr Bounder, as he buttoned his pocket over the bank-notes he had just received—'es the principle of the thing. It couldn't be allowed that a native-born American could be finally taken in and sat upon by a Jew. On no account.—Good-day, mister. Ef you are ever tempted to cheat a Yankee, pause, and remember the "Genuine Teniers."'

FRIENDS.

LET us be friends: we may not now be more;
Your silent glances make but poor amends
For all my pain. Speak as you did before—
Let us be friends.

Love to my heart its fire no longer lends;
'Tis chilled and hardened to its very core:
No quickening beat your presence now attends.

Yet would I not forget the joys of yore;
And now that Fate has worked its cruel ends,
Shake hands and smile; for my sake, I implore,
Let us be friends.

THE CHAPTER OF ACCIDENTS.

'ALL but the impossible may come to pass at last,' sings the poetess; and every year's experience makes us less inclined to define what is 'impossible.' Moralists blame the careless folk who openly put their trust in the 'Chapter of Accidents;' but when one reflects on what singular events appear to occur 'by chance,' how good and evil fortune often seem to come suddenly, unsought and unexpected, one is inclined to make some excuse for the Micawbers who live in hope of 'something turning up.' The Rev. Mr Barham (of *Ingoldsby* fame) relates that it was by an accident that he thought of applying for the canonry he obtained at St Paul's. Going up for the day to London from his Kentish living, he met a friend, who remarked that one of the canonries at the metropolitan cathedral was vacant, that he had written to advise a clerical acquaintance to apply for the appointment, and was now about to post the letter. 'Why should not I apply for the post?' said Mr Barham. His friend immediately tore up the unposted epistle to the suggested candidate. Mr Barham applied for the canonry, and obtained it. Probably, had he met his friend five minutes later, the letter would have been posted, and another applicant received the appointment.

'Casualty has been the mother of more inventions than industry,' writes Fuller, and how often has some apparently accidental circumstance fixed a man's whole after-career! Giotto might have remained a shepherd's boy, Lully a scullion, Lacaille a gendarme like his father, save for the fortunate chance that threw the future artist, musician, astronomer, in the way of patrons who recognised dawning talents.

Novelists are greatly blamed for making so many of their plots turn on odd chances; but it would be difficult to parallel the strange accidents that occur in real life. A writer of short stories once remarked that he had only once utilised real incidents precisely as they took place as the foundation for a narrative, and then the

publisher objected to the tale as 'too palpably improbable.' Afterwards, the writer toned down his facts to the level of fiction.

What incident in a novel could be more extraordinary—more improbable, the reader might say—than the manner in which a suspected 'slaver' was detected in the last century. In 1799 the cutter *Sparrow* brought a brig named the *Nancy* into the harbour at Kingston, Jamaica, under the suspicion that the latter vessel was engaged in the slave-trade. But though many circumstances gave colour to this accusation, no clear proof could be obtained, as the brig had no papers from which such a charge could be substantiated. The court therefore discharged the suspected vessel. But the day before she left the harbour, a man-of-war arrived, bringing some documents which clearly proved the guilt of the *Nancy*. These papers had been obtained in a manner which reads like an incident in one of Jules Verne's works. While cruising off St Domingo, the crew of the man-of-war had amused themselves with fishing for sharks. One monster was captured, and cut up on deck. In its stomach was found a bundle of ship's papers—the very documents which the owner of the *Nancy* had flung overboard when boarded by the *Sparrow*, and doubtless imagined he was rid of for ever. Curiosity led the captain of the man-of-war to clean and examine the papers so strangely brought to light; with the result that he deemed it his duty to lay them before the authorities at the nearest port. The unlucky brig was condemned on this romantically acquired evidence. After this, who shall doubt the story of the marvellously recovered ring of Polycrates?

Probably the most commonplace existence could furnish some curious incidents of what may be called the results of accident—cases in which the chance keeping or breaking of an appointment, a few minutes' delay at a railway station, a casual encounter with a stranger, gave colouring to the whole after-life. How many marriages—and frequently the happiest ones—come about through the chapter of accidents, the precise individuals

who never seemed likely to meet each other coming unexpectedly in contact; and a chance acquaintanceship ripening into affection. An old gentleman was wont to relate that he owed all the happiness of his life to the accident of his future wife having worn a white dress the first time he ever met her, which was at a small musical party. All the other ladies present were attired in gaudy colours, and the simple hue of one young girl's dress attracted his eye. The dress directed his attention to the face, which was a very pleasing one. He obtained an introduction to the lady, found her conversational powers as pleasing as her countenance, asked leave to pursue the acquaintance, and finally married the white-robed damsel—'owing,' as he often remarked, 'nearly forty years' domestic happiness to the accident of a colour.'

Sometimes, unfortunately, the 'accidents' turn in other ways. If we had only refused that invitation to dine with Brown, we should never have made the acquaintance of Smith, who afterwards persuaded us to take shares in so many unlucky 'companies.' If we had gone for our summer holidays to the Lakes, as we first intended, our eldest daughter had never made that unfortunate acquaintance at Clifton which ended in a runaway marriage. If we had not been so eager to secure that Canadian opening for one of the boys, we might have placed him out far more advantageously in Australia, just a month afterwards.

There is a story of a boy who was taken to hear a lecture on anatomy, and who afterwards walked softly, holding his sides, saying 'that now' he knew how wonderfully he was packed together inside, he was afraid of shaking something out of its place.'

When one reflects what important consequences may follow trivial actions, timid people might hesitate at doing anything. Opening a pew door, lending an umbrella, directing a stranger, may have as fortunate consequences as followed the traditional 'good child' in the fairy tales, who is always so amply rewarded for similar acts of kindness. Or, on the other hand, slight civilities may prove like Christabel's kindly assistance to Lady Geraldine; when 'the lovely lady' sank at the threshold, and was lifted over it by the simple maiden, she thus assisted an evil spirit to enter her home, which it could not have done without aid.

It is curious, in reading history, to trace the slight accidents which were followed by such a chain of momentous events. If Cromwell and his friends had been allowed to carry out their project of emigration to America—they were on the very eve of embarkation when stopped by the royal commands—the whole history of the Civil War might have remained unwritten. A bishop has chronicled that, had he gained the position of a chorister, he had never afterwards entered the same cathedral as its bishop: his early ambition would have been satisfied with the position of 'singing man;' but, losing this coveted appointment, he turned his attention to study, with the result of his elevation to the episcopal bench.

The chance that threw *The Faery Queen* into the hands of Cowley, the *History of Turkey* into those of Byron, made, by their own accounts,

a 'verse-writer' of the one, and 'gave an Oriental turn' to the works of the other.

The Shetland islanders have to thank the tempests of 1588, which wrecked one of Medina Sidonia's vessels on their shores, for much industrial fame and profit. Tradition runs that it was from the Spanish survivors of the wreck that the Shetlanders learnt the arts of preparing and dyeing the delicate woollen fabrics now well known everywhere. Many a useful invention, many a valuable discovery, has been made public through the Chapter of Accidents.

A SOLDIER AND A GENTLEMAN.*

CHAPTER VI.—AT DAWLISH PLACE.

DAWLISH PLACE was a fine old mansion, of a kind that abounds in the southern counties. It was straggling and low, having only two stories, and it was almost completely covered with ivy. Where the walls were visible it could be seen that they were built of, or at least faced with, flints; and it had quaint high chimneys, which the clustering ivy made to appear like towers; and irregular gables, which made cosy nooks, filled with warm sunshine, bright creeping flowers, and fluttering birds. It was set fair and free on the southern slope of the Surrey downs, with, before it, a sighing plantation of larches to shield it from the south-west weather sweeping up from the Channel; and behind it, in the high distance, a wood of roaring and towering pines, which broke and baffled the northerly and easterly blasts of winter and spring. Between the house and the larch plantation, sloped and undulated, first, a luxurious garden of roses and other bright and scented flowers, and then an expanse of the greenest turf, with here and there a shady tree. Altogether, it looked as sweet, peaceful, and homely a 'seat' as England could show. Ferrers, being country-bred and also something of an artist, had a good eye for rural effects.

'What a jolly place!' he exclaimed as he approached it with Sir William. 'I should like to paint it.'

'Can you paint?' asked Sir William, looking at him with fresh interest.

'Paint? Oh yes; I can paint.'

'Have you any of your things with you?'

'Yes; I have some sketches—mostly war sketches I made in Egypt. I haven't done much with landscape.'

'That's capital,' said Sir William. 'Bring 'em out to-night—will you?—to show our visitors. It's sure to fetch 'em a good deal. A capital idea!' he exclaimed again.

'There's one thing, by the way,' said Ferrers, 'that I must ask you about. Am I still to avoid all conversation with Miss Dawlish?'

'Well,' said Sir William; 'no, not quite. I don't see how you can keep it up. You needn't avoid her, but you needn't seek her out: you know what I mean.'

'I think I do.'

'Don't misunderstand me, Ferrers,' said Sir William, in a burst of affability. 'It's entirely on account of the—a—business I have in view.'

[* Copyright reserved in the United States of America.]

'So I suppose,' said Ferrers.

The ordeal which Ferrers especially dreaded—sitting down to dinner with a 'lot' of people—came at length, and there had yet appeared no Debrett to sustain him in it. It proved, however—like most other troubles that we fear—worse in anticipation than in experience, though there occurred before it one thing that shook his confidence.

Ferrers had dressed, and reluctantly found his way to the drawing-room. When he entered, he saw that all he expected to meet were there, except Lord Debrett: Aunt Dawlish and Dolly, Mr and Mrs Drew, and his friend Drumly. The 'lots of other people' he had feared meeting, if they were coming, were not yet come.

'Ah, here you are,' said Sir William, avoiding the use of any name. 'Mr Drew and Mr Drumly have been asking me about your doings in Egypt, and I've been telling them about your sketches. Would you mind getting them?'

'Not at all,' said Ferrers, and withdrew.

It was not till he stood in his room with the sketches in his hand that his eye reminded him that they were all signed 'G. F.' What was to be done? He could not obliterate the initials. He must invent some reason for them. He would say—Yes; he was resolved what he would say; and down he went with the portfolio under his arm.

They were much admired by both ladies and gentlemen: they were 'fine,' 'spirited,' 'capital,' and all the rest.

'Is that you,' whispered Dolly, 'on that great long-legged, long-necked camel?'

'Yes; that's me,' said Ferrers.

But Mr Drew was taken up with a spirited representation of a section of the fight at Abu Kru.

'Bless me!' said he. 'I bought a sketch exactly like this the other day at M'Lean's! And with the same initials too!—"G. F." Now, that is droll! Isn't it?'

They all looked at Ferrers—curious, but manifestly unsuspecting; while Sir William chewed his moustache.

'Oh,' laughed Ferrers, maintaining his composure with great resolution, 'that's very likely. Several men wanted copies of the thing, and having plenty of time after we got back to Korti, I did them. It's one of them you must have got. Lady Blencarrow got another, that is now engraved in her husband's book about the expedition.'

'And I paid for it as an original!' exclaimed Drew somewhat ruefully; upon which all laughed—none more heartily than his gorilla-like partner Drumly.

'But why have you signed them all "G. F.," Mr Dawlish?' asked Mrs Drew.

'Well,' said Ferrers, as if embarrassed, 'they are the initials of a nickname my comrades gave me, which I don't think I should utter in—in a drawing-room.'

'Oh,' said Drew and Drumly together; while Sir William laughed and clapped him on the shoulder.

In spite of the success with which he had answered awkward questions, Ferrers was a little anxious: he himself had left at M'Lean's the sketch Drew had bought, and others also. What

if Drew should go and scold M'Lean, and M'Lean should describe the person who had left them? However, he thought, 'Sufficient for the day is the evil thereof.'

But his success in that unlooked-for difficulty helped to make him tolerably at ease over dinner. Moreover, Dolly sat opposite him next Mr Drumly; she looked across at Ferrers very pathetically and tenderly, he thought, and as a consequence his heart was suffused with warmth and his head was charged as with the fumes of wine. He drank some wine, of course; but it was not it that went to his head. Drew insisted on talking of Egypt, and Drumly of Health, and Ferrers replied to both sufficiently. He eloquently enlarged on the chances of Egypt under English rule; of its productiveness; of the patient toil of its fellaheen. He spoke, he declared, as one who knew something of soils, and the soil of Egypt was as fit now to bear corn and rice to feed all England as—he had been told by men who had read a great deal of that kind of thing—it had fed Rome in its ancient days.

'And you think we ought to hold it?' asked Drew, as if hanging on his answer.

'Certainly,' said Ferrers; and Drew leaned back in his chair satisfied.

'By the way, Sir William,' said Drumly, 'I had no idea your son had such a knowledge of agriculture as he seems to have: soils and crops, grains and roots, he appears to know all about. I was saying to him the other day that he ought to persuade you to let him manage the estate. You don't make so much out of it as might be made—do you?'

'No; I'm afraid I don't,' said Sir William, with a vicious snap. 'But before he takes over the whole estate, perhaps he might try his hand at the management of the Home Farm.'

'A good idea,' said Drumly seriously.

'You don't take him, Drumly,' laughed Drew. 'Sir William means, of course, domestic matters. "Home Farm!" Don't you see?'

'See what?' asked Drumly.

'See that Sir William means that the young man had better set up house first.' And he laughed again.

As for Sir William, he sat silent; he nodded, and 'smiled, and smiled, and'—

Ferrers on his part sat—with a fixed smile—for a second or two in dense incomprehension, and when that passed, in a rush of shame and resentment. The sly, roundabout allusion of Drew was to his possible marriage—his, as William Dawlish! With whom? With whom but his *vis-à-vis*!—with Dolly? Was not that plainly declared by the laughter and pointed looks of Drew and Mrs Drew; by the downcast, blushing face of Dolly herself; and even by the meaning smiles and glances exchanged by the servants in waiting? Was that, then, he asked himself in quick thought, the kernel of Sir William's plot?—the consummation towards which he was urging his carefully laid plans? But he could not really mean him—him, George Ferrers!—to marry Dolly! Speculation, however, on all these points set his brain in a whirl, and he recovered with a voice in his ear.

'Potatoes, sir?'

A servant was at his elbow with a dish of vegetables. He helped himself and continued

his dinner. In spite of the doubts and questions that were surging in upon his attention, he must go on playing his part of a person who was not himself, who was probably very unlike himself in nature if not in person.

Having had his mind thus brusquely turned to consider his situation, he regarded it with more concern and uncertainty than had yet troubled him. He was like a soldier who, going fairly and cheerily along, comes to himself to find that he is in the stronghold of the enemy, and, like the soldier, he began to look warily about him. The glances and smiles of the servants a moment before made him note them: what did they think of him?—whom did they take him for?—for their young master?—and if they did, how long it must be since they had seen him, or else how like each other he and the true Will Dawlish must be, or must have been! That last reflection made his flesh creep. Did he really and truly bear a close resemblance to a dead man? And was it because of that resemblance that Sir William had thought he might readily appear in the dead man's place? Imagine his consternation when, as he was thinking thus, Dolly bent a little towards him, and with a glance at the wall behind him, said: 'I have not seen you look so like your portrait before.'

He turned, and saw an oil-painting of a beardless youth of eighteen or so, slim and presumably tall, with a pensive, frightened, and somewhat worn look. The startling thing, however, was that in the set of the hair and in the general cast of the features—except, perhaps, in the thinner and finer modelling of the nose—the portrait of the youth might be taken for a portrait of him, George Ferrers, when young!

'Yes,' said Sir William, with Delphic duplicity, 'he did look very like that then.'

(*To be continued.*)

ANTIQUE CABINETS.

It has been said that there is no furniture for a room to compare with books; and to the man of letters what can be pleasanter than to be surrounded by the friends he loves? But to many connoisseurs and lovers of art, with the exception, perhaps, of a painting, there is no more beautiful decoration for a vacant space than an old-fashioned Cabinet. Some feeling of sentiment lingers round a cabinet, as round a chair. We seem to realise something of the love of nature and of all that was beautiful in life, which inspired the artists of the Renaissance in looking at one of those cabinets, matchless in elegance and perfect in detail, with which the despots of Italy in the middle ages loved to surround themselves. How many memories, too, are associated with our own mahogany presses and cabinets, such as are to be met with in many an old farm or manor house, the drawers of which seem yet to keep a faint scent of rose-leaves or lavender. Pieces of furniture like these have perhaps been handed down from father to son for several generations, and seem to form part of the history of the family. Their secret receptacles and drawers can doubtless account for many lost wills and many mislaid sums of money.

Modern cabinet-making is a very different thing from what it was in early days, when the

master with a few workmen superintended each piece of work, which in this way was never far removed from the designer's eye. At the present day, both here and abroad, furniture-making is to a great extent in the hands of large firms, and much subdivision of labour, and consequent loss of unity of design, is the result. Some loss of artistic effect is also due to the use of machinery.

In former times, especially in Italy and France, cabinet-makers were often men of the greatest skill as artists and designers, and their products were marvels of ingenuity and patience, inspired by a love of art which has always characterised the two nations. Italy was for many years foremost in the production of beautiful specimens of the cabinet-maker's art, often in the shape of stately chairs, caskets, or large coffer enriched with carvings, which contained the clothes and valuables of the family. Marquetry-work was employed in Italy in very early times under the name of 'Tarsia,' the word marquetry being derived from the French verb *marqueter*, to checker or inlay. The Tarsia work of the Renaissance was a kind of mosaic in woods. It consisted in representing houses and other buildings in perspective by inlaying pieces of wood of various colours and shapes into panels of walnut-wood. Chair-backs in the reign of Charles I. in England were decorated in this way, as also wainscots and the panels of doors. It was in the sixteenth century more especially—the 'Cinque-cento' period—that Italian cabinet-work reached the greatest excellence. Not only were cabinets made of carved and painted wood with elaborate gilding, but 'Pietra-dura'-work was largely employed. This consisted of inlaying a piece of furniture with hard pebbles, such as agate, lapis-lazuli, and the like. Gradually, this style of decoration, called Florentine mosaic, became so popular that wood was no longer used except as a simple framework. Of the woods used, ebony was perhaps most in favour; and for inlaying, carved ivory and tortoiseshell were frequently employed.

French cabinet-makers were not slow in copying and, in the end, rivalling the productions of the Italian artists. One of the earliest French cabinets was purchased by Francis I., and was of gilt leather with arabesque designs. Inside were two drawers and a little chapel or oratory. In England, cofferers were still in use, and had hardly as yet developed into the form of a cabinet. Henry VIII. possessed one of them, as we learn from the following entry in the royal accounts: 'Paid William Grene, the King's coffer-maker, for making of a coffer covered with fustyan of Naples, and being full of drawers and boxes lined with red and greene sarcenet, to put in stones of divers sorts—vi. li. xviii. s. and ii. d.'

Catharine de' Medici possessed as many as seven or eight cabinets, and at this period they began to be much prized in France. One belonging to the French king, Henry IV., had a façade of cedar ornamented with eight Corinthian columns of the same wood, with gilt bases and capitals. In the centre appeared in a recess the equestrian figure of the king treading his enemies under foot. Its height was about six feet eight inches. At the death of the fair Gabrielle d'Estrées, the same king directed her favourite cabinet not to be removed or its treasures of jewellery and nick-nacks disturbed. The princely Mazarin is said to

have possessed as many as seventeen cabinets of ebony.

In Germany as well as France cabinet-making attained a great pitch of excellence, and the decoration of furniture was nowhere more elaborately carried out with the help of the goldsmith and the jeweller. The chief seats of the manufacture were at Nuremberg, Dresden, and especially Augsburg. Among German cabinet-makers none were more famous than Hans Schieferstein, in the middle of the sixteenth century; or, later on, Schwanhardt, Kellerthaler, and Ulrich Baumgartner, the last of whom made a cabinet at Augsburg in 1616 for a Duke of Pomerania on which as many as twenty-five artists were engaged.

Another important piece of furniture in the sixteenth century was the sideboard, called in France *dressoir de salle-à-manger*. There were small cupboard with rows of shelves on the top. The old etiquette of France prescribed five steps or shelves to these sideboards for use during meals for queens, four for duchesses or princesses, three for their children, and so forth.

The cabinets of the seventeenth century were generally architectonic compositions, that is to say, following the outlines of buildings—answering to the chimney-pieces with columns or pilasters on the angles and the panels of the doors, carved with little reliefs representing such virtues as Temperance, Prudence, and the like. They were usually of considerable height, and came in large numbers from Flanders, where Mechlin was a chief seat of the trade. The fronts were carved and put together, and then floated down the canals of the Low Countries to Bruges and Antwerp, whence they were often sent to Harwich and other towns on the east coast of England.

In France, the reign of Louis XIV. was especially notable for the attention paid to all branches of the fine arts, and not least to that of cabinet-making. The powerful Colbert established art schools and factories in various parts of the country, among which that of Gobelins was perhaps the most famous, under the direction of the artist Lebrun, and afterwards of Mignard. Now it was that what is known as Buhl-work, which had attained considerable excellence in Italy in earlier days, was made the fashion in the salons of Paris by André Boulle, a carver in wood, born in 1642. This work consists of a design cut out in gold, silver, brass, or other metals, by means of a very fine saw, and then let in or inlaid into ebony or other woods, or into ivory and tortoiseshell. The designs of Boulle's cabinet fronts were partly borrowed from the outlines of antique Roman altars. His cabinets had frequently pedestal tops, on which were placed those stately clocks with arched frames and embossed gilt faces which are so familiar to us. The king, in recognition of Boulle's skill in artistic designs, entrusted him with the furnishing of the palace of Versailles.

No form of decoration for furniture is more effective than marquetry-work, which consists in the inlaying of slices of rare and costly woods, which are fastened down with glue by means of screw presses made to fit the surface to be covered. Sometimes the woods were shaded by means of hot irons or heated sand, which produced brown or dark yellow tints. Other colours, such as green or blue, are obtained by steeping the wood

in various chemical solutions. Occasionally, finely graduated tints can be produced by splitting and laying slices of the same wood with the grain running in different directions. The herringbone style of marquetry was practised in very early times, especially in Italy.

Under the later Stuarts, much French furniture was imported into England, though the old Tudor oak lingered on in country-houses. The decoration of our furniture up to the Revolution had been largely due to carvers, such as Grinling Gibbons. In the reign of William III., when Dutch workmen and Dutch furniture found their way into England, marquetry became common. It is at this period that the furnishing of an English mansion may be said to have been completed. The style of decoration which has been lately revived then came into existence. There was a passion for porcelain à la Chinoise, with quantities of small brackets following the outlines of the panels and mantel-pieces, on each of which stood a small cup or jar. Japanned cabinets were much in fashion, on which were placed the monsters, mandarins, and other pieces of Oriental bric-à-brac in which the age delighted.

Mahogany, which is said to have been first used in carpentry in repairing a ship of Sir Walter Raleigh, did not become commonly employed for furniture in England before the middle of the last century. Other woods of a light colour, such as lime, pear, holly, and beech, were much used. Ebony and other exotic woods had come into more general use in Europe from the end of the seventeenth century, the period when the Dutch settled in Ceylon. Marquetry of ebony inlaid with ivory was made in Italy, and the same wood inlaid with mother-of-pearl in Holland.

The last century produced many talented cabinet-makers in France, chief among whom was Riesener, born near Cologne in 1725, and cabinet-maker to Louis XVI. His work was laid out on a ground of tulip or purple wood, and in patterns of lime, pear, and other light-coloured woods delicately varied. Riesener's work bears his name stamped on some part of it, and fetches a very high price. Another cabinet-maker of note was David Roentgen, more commonly called 'David' simply. A piece of furniture which now became very fashionable was the 'commode,' a kind of low cupboard with drawers and a marble top. It was probably introduced in the early years of the eighteenth century; for the Duchess of Orleans—the mother of the Regent—writing in 1718, describes one which had been given as a present to her daughter by the Duchess of Berry. In the drawers were all kinds of articles of apparel then in fashion. The commode took the place of the old chest or coffer with a lid, which was certainly 'incommodious.' About 1720, commodes were much in demand, for in the fire at Boulle's workshop in that year eighteen of them were burnt, some ornamented with marquetry with bronze mounts. One among the many made for Madame de Pompadour in 1750 was 'lacquered with pagodas, ornamented with gilt bronze, and the drawers lined with embroidered satin.' This cost two thousand four hundred livres—a large sum in these days. Another favourite ornament was the 'console' table, which was fixed against the wall,

and made of carved and gilt wood with a marble top.

The general style of the 'Louis Seize' period in furniture consists of mounts or decorative edgings, borders, lockplates, and so on, applied to wood carefully veneered. Sometimes furniture was made up with panels of Chinese lacwork—which caused many Oriental cabinets to be taken to pieces—or with panels of Sèvres porcelain or with porcelain cameos, such as our own Wedgwood produced.

China medallions were much used from the reign of Louis XV., who was the founder of the porcelain manufactories of France. A well-known artist in metal-work applied to the cabinets and other furniture of this period was Gouthière, whose mounts were cast in bronze thickly gilt and carefully chased. His subjects were little Cupids or grotesque figures modelled from nature. Robert Martin, born in 1706, introduced the fine lac polish with which much of the furniture of this age was adorned, and which bears the name of 'Vernis Martin,' though probably enough the secret of the process was derived from Japan, through some of the missionaries who had resided there before the occurrence of the great massacres which closed Japan to all but the Dutch traders. Martin and his brothers painted and polished furniture of all kinds, from carriages and wardrobes to fans and snuff-boxes, frequently employing good miniature painters for the designs of Cupids and shepherdesses with which their work is ornamented.

In our own country, the eighteenth century also produced some well-known cabinet-makers. The brothers Adam, whose relationship is commemorated in the block of buildings erected by them between the Strand and the Thames, and called the Adelphi, excelled not only in architecture, but in designing cabinets, sideboards with elegant urn-shaped knife-boxes, console-tables, and the like. Thomas Chippendale came up to London from Worcestershire in the reign of George I., and established himself as a furniture-maker in St Martin's Lane. He published several works, and his designs became so well known, that much of the mahogany furniture of the last century is loosely called by his name whether made by him or not. Designs showing still greater taste and delicacy were produced by Heppelwhite and Sheraton a quarter of a century later.

During the last half of the century, satinwood was very fashionable for tables, harpsichord cases, and the like, which were often embellished with medallions or cameo ornaments, and borders painted by Cipriani or Angelica Kauffman. The discoveries at Herculaneum and Pompeii gave an impetus to classical ideas as applied to the decoration of furniture; and the French Revolution, followed by the long war, partially destroyed most of the artistic manufactures of France. During the rule of the First Napoleon, a new style, known as the 'Empire,' grew up, and is distinguished by a certain stiffness and affectation of classicism shown in the metal mounts of its veneered mahogany furniture, and in the carvings of the legs and backs of chairs. Some years later, a return was made in France to the style of the seventeenth century. In recent years in our own country we have gone back to the

fashions prevalent during the first half of the last century; while the style most copied in France has been that of the 'Louis Seize' period.

The modern cabinet trade is a very scattered one. In London alone it has been calculated that there are upwards of thirty-three thousand cabinet-makers, living chiefly at Shoreditch and Bethnal Green, at which latter place most of the old weavers' homes are nowadays inhabited by furniture-makers. A great many Polish and German Jews earn their living in this trade, while Italians and French are much employed for work of the higher class. The demand for cheap furniture is responsible for much badly-finished work, in which nailing takes the place of dovetailing, veneer is of the thinnest character, and the glue-pot covers all deficiencies. At the present day, though much furniture of considerable excellence is produced by the well-known firms, we suffer greatly from having no style that can be said to distinguish our country or the age in which we live. The cheapness, too, of modern furniture, while a considerable boon to the poorer classes, is not productive of skilled workmanship; and great competition added to unlovely surroundings have left little room for the taste and love of art for its own sake which once distinguished the cabinet-maker's trade.

THE TROUBLE AT GREAT BUCEPHALUS.

CHAPTER IV.

THE detour occasioned by the 'Eltran outfit' leaving the road to Strapley's Mills so much prolonged the journey that the party were two nights on the plains ere they reached Ophirville, greatly to the terror of little Mrs Boytell and her sister, who were less used to such experiences than were the Eltrons; and not a little also, it must honestly be confessed, to the scaring of Boytell himself, who lay awake half the night, listening to the bark of the coyote or prairie wolf, and, what was even worse, watching the movements of objects and shadows which only existed in his own imagination, but which are always to be seen by those who are new to the prairie, who will also hear a host of vague ominous sounds, alike fanciful.

Eltran and Trayle felt more anxiety during the day; and the sight of a solitary Indian horseman would have been to them a hundredfold more alarming than any vague or 'creepy' sights and sounds. Happily, no interruption occurred, and the little cavalcade arrived at Ophirville in safety. Here they soon heard enough to show them what dangers they had escaped. Two wagon trains which followed them had been attacked near Three Water Ford and almost every soul slaughtered. One or two escaped by the swiftness of their horses, and the reports they gave were such as are related of every Indian massacre, but which need not be repeated here.

Yet some farther events arose from this slaughter. The spirit-seller—or one of them, for there were several such at Great Bucephalus—had decided to remove the best of his stock; so one of his wagons was partly laden with brandy and

whisky, objects literally priceless in an Indian's eyes, for he must not buy them, nor dare any one sell them to him. This wagon was captured by the savages, and the debauch which followed can easily be imagined; but it had one unlooked-for result. The infuriated warriors resolved upon then and there attacking Strapley's Mills, which they did with less of the craft, and what in other bodies would be called cowardice, than usually mark Indian approaches. The result was a complete and disastrous defeat. Many of the Indians, both warriors and squaws—for all alike had drunk the fire-water—were killed; no other words are required to express their fate. To be wounded or prisoner meant the same thing—death. The white man in such a contest is as merciless as even his Indian enemy; he feels that chivalry, or even a shred of humanity, would be thrown away upon such brutal adversaries. No evidence can be stronger of this than that white men will often use the hideous scalping-knife as readily as the Indians themselves.

Some great chief had been killed in the attack on the Mills; it was not certain who this was, as his body had been removed; but while some averred it was old Simon himself, others, who professed to be as well informed, declared that it was a white man, one who had been prominent in the attack upon the wagons, and who was, there could be little doubt, Adobe Rube.

To have got rid of either of these men would assuredly be a great benefit to the district; but for all that, a sort of hope was afloat that it was not Rube. It was felt that to be killed in open combat was not the fate which should have been reserved for him; so that, strangely enough, many a man who would have rejoiced in aiding at his death, regretted to hear that he had really gone.

News also came from Great Bucephalus, which showed that the exodus from thence was made none too early. It was attacked on the day after the fight at Strapley's Mills, perhaps by the same party, for the assault was not so fierce or so well sustained, the redskins seeming only half-hearted. However, they burnt the greater part of the town, but did no more, beyond keeping up a kind of desultory siege of the houses in which the few remaining inhabitants had taken refuge; a siege in which only a few casualties occurred, and which only lasted one day. After nightfall, the Indians disappeared, and the unfortunate citizens were at liberty to rescue all that might be saved—it was but little—from the wrecked town.

The loss of so many acquaintances, and the disaster which had fallen upon what had so lately been their home, could not but affect the Eltrons and Phil Trayle—Boytell and the other new arrivals were horrified—but out West the spirits are elastic, and even such a tragedy as this was soon remembered only as those in other communities remember great railway accidents, large fires, and the like.

Eltran soon found a store to suit him. Boytell, as had been proposed, secured a ranch just beyond the city, in which he intended to dispose of his produce. For this, the demand, it was confidently prophesied, would soon be much greater than the present means of supply could meet. This was in accordance with previous

arrangements; but, much to the surprise of the Eltrons, Phil Trayle unexpectedly declared his intention of living on the ranch and sharing in that speculation. Perhaps Mrs Eltran, having keener perception in certain matters, as becomes a woman, was not altogether so much surprised as was her husband. Whatever might have been the latter's opinion at first, he soon became aware that Agatha, his wife's sister, was the great attraction which drew the young fellow to the farm. Had there been a possibility of doubt upon this subject, an early and particularly straightforward declaration of his views, which Phil made to his partner, and had no doubt previously made to the young lady, quite settled the matter. There were not many obstacles likely to be in Phil's way, for all liked him; he was a strapping, good-looking young man, and—a consideration not to be wholly ignored in these prosaic days—was much richer than any of his present friends. So in his case the course of true love ran smoothly enough. We are not concerned with the details; but it may be easily imagined that these were sufficiently absorbing to concentrate the thoughts of the young people on themselves.

Yet some tidings occasionally floated in from Great Bucephalus. An attempt had been made, it appeared, to revive the city; but this had not been successful, and the place only held a handful of inhabitants. Then some reports came in, having reference to Adobe Rube, who was at first declared certainly to have been killed at Strapley's Mills; then, with equal positiveness, it was said that he had been killed and scalped by his Indian allies, some of whom he had shot in a paroxysm of drunken fury. Then, this again was superseded by his supposed identification with one Richard Gately, who had been lynched at a town some two hundred miles distant; an eye-witness was said to have recognised him. Of Minnie nothing was heard; and whichever of the stories, if any, was true, her fate seemed equally pitiable, and the inmates of the Eltran store often spoke of the poor girl.

Ophirville was to be in time to come a great mart and trading centre; at present it fell short of this, and the old struggles had to be renewed by Eltran. Yet it was better than Great Bucephalus; and there really seemed some reason to hope that when the gold-fields were fully developed, the town—and by consequence, the farms—would prosper. The only drawback was that the process might be too tedious for poor Eltran's reduced capital; but he hoped for the best; and meanwhile he and his friends lived peaceably and quietly in the new neighbourhood.

Nevertheless, some little roughness occurred among the miners, and a few trifling disputes arose, at first settled by means of revolver or bowie-knife; but these were afterwards supplemented by the action of Vigilance Committees. The Ophirville gold-fields had much the same stories to tell as have always been told in such places, yet they were so far from being the worst of their kind, that a compliment to the law-abiding citizens who congregated there was expected to form a part, and did form a part, of every public speech delivered in the community.

Chiefly by the patronage of this law-abiding community, Eltran, with his friends Boytell and Trayle, continued to keep afloat; and, justified rather by hope than by actual success, the marriage of the last named with Miss Agatha was fixed for an early date, and Mrs Eltran had arrived at the ranch to give her help till the wedding was over. Agatha, had she been so disposed, could have made a selection from several swains; for eligible brides being scarce in Ophirville, none of the few who did arrive remained there long before the services of the magistrate, the official 'Squire,' were called into requisition.

The day fixed for the wedding was only a week distant, when one morning there rode up to the ranch a man who had come straight from the gold-fields, and he told of an unusually sanguinary affray which had taken place there, and was not likely, he thought, to die out for a day or two; for the miners had determined to drive away or extirpate the whole of a notorious gang of thieves, gamblers, and suspected murderers, who had long been a terror and a nuisance to the law-abiding citizens aforesaid.

Trayle had intended to ride over to the gold-fields that day; but on hearing this story, he faltered in his resolve. He was as fearless a Yankee as ever left the State of New Jersey, and had shown 'real grit' on more than one occasion; nevertheless, when a man is in love and is to be married within a week, he is apt rather to prefer the keeping out of broils than the seeking for them; so it was with Philip Trayle. In lieu of the intended trip, he rode with his friend Boytell to a village—if any villages exist out West—where they would probably do a smaller but safer trade than in the excited gold-fields, and from which they could return on the same night.

So Mrs Boytell, Mrs Eltran, and Agatha were with the children and servants—the helps—left at the ranch; but this was no matter of dread with them. Their men were both armed, and some powerful dogs formed guards almost as formidable; yet, when the quickly closing-in nightfall had come, and all was silence and blackness without, the sudden and fierce baying of the dogs, which announced a strange step, startled the women. One of the men opened a door, and evidently held a brief parley with somebody; then coming to the sitting-room, said that a man, a stranger, wished to see Mrs Eltran, and must see her at once. 'He has got the real grit,' added the speaker; 'and the dogs know it, for the two Texas hounds went for him; but they are frightened of his voice, and have slunk back, and daren't come anigh. Will you come and see him, madam?'

A good deal surprised by this visit, Mrs Eltran nevertheless agreed to see the stranger, who had refused to come in; and so, accompanied by Agatha, she went to the door. The two men, each, almost of course, holding a rifle, remained in sight, although not in hearing.

The night, though dark, was clear, and Mrs Eltran could see the visitor pretty distinctly, and she could also see the two savage hounds, which, as the labourer had said, were watching the man from a distance. Mrs Eltran began

an inquiry as to the occasion of this call; but the stranger interrupted.

'Do you not remember me?' he said.

'N-no,' replied the lady; but her voice faltered as she spoke.

The man noted this, and there was a harsh smile on his features as he continued: 'Yet you think I am considerable like 'Doby Rube, who has been, or who ought to have been, lynched half-a-dozen times. You are right, madam; it is Rube.'

'I know you now!' exclaimed Mrs Eltran. 'Come into the house, and then you can'—

'No,' said the man firmly. 'I am not presentable now. You would see more bruises and blood-stains than would be pleasant. My time, too, is short. I stand on the edge of a precipice while I talk here; but I must confide in you here and your friends. There are not many other persons in all the wide world beside whom I dare trust. I want you to do me a great favour; it is the last I shall ever ask of any one. I want you, Mrs Eltran, to do what you once did for me before—I want you to take and look after my Minnie.'

'I am sure we should all do everything in our power for the child,' said Mrs Eltran; and Agatha added: 'We have all heard of her and her gentle ways; and we all love her, and have grieved for her. My brother has tried in vain to find her: he thought she had gone to another State, or perhaps'—

'Or perhaps, with her father, was dead,' said Rube, finishing the sentence. 'Yet, madam, I have lived within twenty miles of Great Bucephalus all the time. I was one of the leaders of Jornel's band. Have you ever heard of Jornel?'

The frightened repetition of the name, and the woman's involuntary shudder, sufficiently answered the question, for to the account of this the most notorious gang of desperadoes on the frontier were laid half the crimes of the district, crimes always of the cruellest and most sanguinary character; and this was the band to exterminate which the miners had combined.

'But we are played out now,' continued the man; 'we have had a fuss at the gold-washings; the alcalde is killed, and all the county is roused. I reckon most of the band will be cleaned out right away; and so I wish to give my Minnie once more into your charge if you will take her. She shall be no expense to you, although she is the daughter of 'Doby Rube.'

'If we can do anything to help or protect the poor child,' began Mrs Eltran, 'we shall not look for payment, or'—

'My time is too short for argument,' abruptly recommenced Rube. 'Here are the title-papers for a section of land close by Bucephalus. Your friends did not know it; but the Indians did, and I do, that the spot of which this is the centre is the richest gold-bearing earth on this continent; and Minnie will be an heiress by owning half of it; for I wish her guardians to divide it with her. This bag is not for Minnie; it is a present for the three ladies.—You need not hesitate to accept it,' he said, as Mrs Eltran drew back; 'this at anyrate has no taint of blood or crime upon it. Minnie's address is in there, with an order to the woman in whose care she is to give her up.—I have often thought of taking her into the States to school; I wish I had

done so; but it is too late now. I shall never see her blue eyes and fair hair again. I loved her better than you may think possible, and if her mother had lived— Do not let her know, if you can help it,' he said, raising his voice, 'what a bad man her father was; his only merit was in being fond of her.'

'But why need you bid her such a farewell?' urged Mrs Eltran. 'You should leave this district, and take her to school, as you have just said, and then you might live, I hope, a better life. If we gave you shelter until'—

'If you did so,' exclaimed Rube, 'the men whom I can see at the end of this lobby would give me up to the sheriff, or shoot me at once, directly they learned who I was. Besides, madam, I cannot desert my comrades. Indeed, I doubt if I could get away from the territory, even if I tried, for the alarm has been sent out for a hundred miles round. They mean clearing off Jornel's band, and we will all live or die together. The sheriff may be here at any minute, to call out your husband and Philip Trayle; and I should not like to cause a fight in your doors, so I will go. Even from such a wretch as I am, a blessing may be given to my innocent Minnie; and if my good wishes for you and yours can avail, I give them heartily.—Good-bye; you will never see Adobe Rube again.' He turned as he concluded his speech, and in another instant had disappeared in the darkness, the Texas dogs uttering a savage growl in farewell. And his words were fully realised.

Adobe Rube was never again seen by any of the characters who have figured in our story. And excepting for the information he had given that night, it would have been difficult to guess his fate.

Boytell and Trayle when they came home brought ample confirmation of the excitement and indignation caused by the murder of the alcalde, or justice, and how the fiery cross, it might be said, had been sent out. That Jornel's band would be surrounded and no quarter given or taken in the fight, was considered as certain; and it was evident that Trayle, and perhaps even Boytell, had a hankering to join in the sport, the former strongly doubting as to whether a full-blooded white Yankee citizen ought to stay away from such important legal proceedings.

When they heard who had been a visitor during their absence, they could not but rejoice at having missed him, as they had heard so much of the outrages of the gang, that they could scarcely have allowed him to depart. An examination of the articles left by Rube showed that the title to the land was sufficiently correct; and there was, moreover, a kind of will, signed by Rube, but drawn up in a more clerkly hand than the outlaw was likely to boast, giving certain effects to Minnie.

This property, it appeared, was stored at the farmhouse which was the girl's temporary home. The document went on to ask Mr and Mrs Eltran to adopt the child, and gave to them and their friends at the farm a bag of rough uncut jewels—the same, no doubt, that he had now brought.

No time was lost in finding Minnie, who wept with delight on seeing her kind friends again; and on finding that they had come to take her from the unutterably dull and solitary hut which

far up, in some almost pathless hills, was her abiding-place. But ere the little party had returned to Ophirville with their charge, they heard news on the way, which, happily, poor Minnie never learned.

It is not worth while to dilate upon it here; the history and catastrophe was only one out of many frontier examples; but whatever scourges might arise in the future, Jornel's band was gone, 'played out,' as Rube had said; and the law-abiding citizens who had shot or hanged fifteen or sixteen of them in one day, rejoiced, as such peace-lovers should do, while seated under their vines and fig-trees.

There was nothing to surprise in this; but a double surprise was in store for Eltran and his friends. Amidst almost general ridicule, and openly expressed jeers, they took possession of and proceeded to explore the ground at Great Bucephalus, and, almost in the first washings, proof was given that Minnie was indeed an heiress. The child had happily fallen into honourable, kindly hands. She was sent to a good school in Philadelphia, two thousand miles away from the scene of her father's wild career and death; but she believed he had died a miner, after running the usual course of a miner's life. This she believed; and so did her husband, for she married early, as girls generally do in 'the States.'

The other surprise to which reference has been made was the amazing value of the parcel of precious stones which Rube had given to the guardians of his daughter. These consisted not only of the magnificent garnets for which the country was famed, or the beautiful moss agate found there, but of the finest rubies and emeralds also, some of them being of almost priceless value. These had never before been met with there, or within thousands of miles. The Indians perhaps knew where to get them; but they kept the secret, if it were theirs to keep. Be that as it may, the gems were so valuable that on the advice of experts they were sent to Holland for cutting and sale, the proceeds fully securing the prosperity of the 'Eltran outfit,' which of course included Boytell and Trayle. These all held on until Ophirville grew quite the central point of an important district, and until their stores and their farms were famed for a hundred miles round.

PENSIONED LIFE-GUARDSMEN.

PROBABLY many people who have stood admiringly gazing at the massive mounted cuirassiers within the boxes at the Horse Guards, or have seen the glittering escorts of Household Cavalry on duty on some state occasion, may have experienced a passing feeling of curiosity as to what becomes of those sons of Anak after they have retired into civil life. When they have finally doffed the plumed helmet, breastplate, buckskins, and jack-boots, and handed them into the troop-store—from which establishment the articles are issued to juvenile successors—when they receive their discharges, and make tracks out of the barrack gate, attired in the prosaic raiment of ordinary citizens—to what vocations, generally

speaking, do those giants betake themselves? In our article we shall endeavour to throw some light on the subject; but we shall only deal with the veterans who have put in their allotted span of twenty-one years, and not with the hosts of younger life-guardsmen who purchase their discharges, are invalided, or leave at their 'twelve.' In passing, we may mention that the last class is largely absorbed into the police and railway services.

With civil life comes plain attire. Perhaps the non-commissioned officer especially resigns his gorgeous aiguillettes and embroidered tunic and cap with something like a pang. 'Gold-lace has a charm for the fair,' says Mr W. S. Gilbert in *Patience*; therefore, the admiring looks of the gentler sex are probably lost to him for ever. It is sad to think that never again may he be fated to hear, while stalking along the street, arrayed in a coat resplendent with auriferous trimming, Mary Jane's ecstatic exclamation to Susan her companion: 'My eye—what a gor'jus, 'andsome man!'

The time-expired trooper, on the other hand, if he be at his ordinary duty, hears—with possibly a fervently ejaculated 'Domino!—the order 'Leave stables,' the last time for him, with considerable satisfaction. No more for him in this life, Queen's and barrack guards, escorts, levées, drawing-rooms, or field-days, with the accompaniments of endless grooming, polishing, burnishing, and pipeclaying. He receives his 'ticket,' as it is termed in martial slang, disposes of the articles of his cleaning kit to the highest bidders, stands a few pots of beer to his late comrades in the canteen, bids them farewell, and provided with the sinews of war in the shape of 'deferred pay,' hastens from the arena in which he has spent over two decades of his existence to the greater world outside barracks, in order to revel in the delights and comparative irresponsibility of civil life.

About the pensioned Life-guardsmen's future career. Well, though he may have been non-commissioned officer or private, the function of Cerberus constitutes the avocation which he fills fitly and naturally. Who more suited for the post of hall or gate keeper than an erect, burly, florid-faced, heavy-moustached, six-foot veteran? His martial training inclines him to perform his often automatic work with a stern sense of discipline, and a composed dignity that impresses all who come into contact with him. As Cerberus, he is the right man in the right place; he is the model of punctuality, and is always ready when wanted. He is civil in demeanour, but a trifle stand-offish when familiarly addressed by a flip-pant stranger. However, he is a man who, though possessed of a proper sense of his own importance, is—to quote from a popular music-hall ditty—'All right when you know him, but you've got to know him first.'

Bullamy, the haughty but respectful porter of the shady Anglo-Bengalee Disinterested Loan and Life-assurance Association, as described in *Martin Chuzzlewit*, who started and awed onlookers by bellowing lustily, 'Room for the Chairman of the Board, Gentle MEN,' was scarcely tall enough for an ex-life-guardsmen, though, judging from that worthy's characteristics, he ought to have been one. Perhaps Mr Bullamy, after all, was but

a trumpery imitator, and a weak copy of some quondam cuirassier of his day and generation. But as far as pomposity of style is concerned, Bullamy has a host of ponderous after-types in the ranks of contemporaneous liveried porters, who have been put through the goose-step on the barrack squares of Albany Street, Knights-bridge, or Windsor.

Again, the retired life-guardsmen—usually in this case a man who has worn the chevrons—is greatly in request as the custodian of public parks and garden enclosures. His enormous trained lung-power, erst exercised in his lusty hectoring of recruits on the square, or in bellowed commands to his troop, at this occupation comes in handy. The volume of sound he can emit, while bawling from a distance, at trespassers and evil-doers in the shape of predatory children, seldom fails to strike such juvenile aggressors with awe. Possibly, in an obscure street close at hand, our friend's wife may keep a small general shop. There, when his day's labour is at an end, and the keys are turned in the gate-locks of the horticultural tract he guards with such jealous care, the stern keeper puts off his dignity and his livery at the same time. At intervals during the evening he may actually condescend to serve at the counter, and chat with many dowdy ladies, the helpmates of the horny-handed fraternity, with quite a charming display of affability.

A number of twenty-one years' life-guardsmen become attached to the corps of Commissionaires; but such have to conform to the discipline and usages of that useful body, and call for no special remark. A few pensioners, who have either saved money, or have been fortunate enough to marry wives possessed of a balance in the bank, start public-houses. Needless to say any such hostelry has a magnetic attraction to all the ex-warriors who have belonged to the same corps as the landlord. There they habitually assemble, and chat over old matters regimental.

One or two discharged privates are appointed barracks-sweepers, and in a semi-official capacity accompany their corps from place to place, just as they did while on the active strength. Another small contingent, usually broken-down fogies who have come to grief after leaving, hang about their former comrades, and earn a precarious livelihood by doing any odd job, from getting a private ready for guard, to taking an occasional watch or chain or ring to a pawnshop, or redeeming the same.

The officers are generally willing to recommend a deserving and trustworthy pensioner when he applies for a berth; but, all the same, they are reported seldom to interest themselves in procuring him one. Their servants, however, are usually well provided for. Such functionaries are frequently relegated to the ancestral homes of those patrician commissioned gentlemen, where they figure as valets, footmen, and so forth. Ex-servants who have been lucky enough to wed ladies endowed with genius in the direction of 'managing,' have been actually known to attain the social altitude of Bloomsbury boarding-house keepers.

Many of the smartest of the non-commissioned officers, in common with men holding similar ranks in other cavalry corps, are appointed to

troops of provincial yeomanry regiments. One or two others, obtaining the posts by extra-special influence, don the Tudor costume, and as Yeomen of the Guard do duty at the Tower and on State ceremonial.

The farriers, as a rule, stick to their particular profession, and, when discharged, start forges all over London. The bandsmen, who, as is well known, are picked and highly-trained musicians, on retirement carry on the engagements in the orchestras of theatres, music-halls, &c., that they may have held throughout their regimental careers. At times the bands of their old corps may enter upon an important provincial engagement, when, for various reasons, the strength requires to be temporarily augmented. Then, by special Horse Guards authority, the services of those pensioned musicians were requisitioned, and again they attired themselves in the uniforms of their former regiments. A recently issued order, however, has withdrawn this privilege, which may have the effect of preventing the bands of the Household brigade from accepting provincial engagements.

The commanding officers of the corps of Household Cavalry possess the power of summarily, and without the preliminary of a court-martial, disposing of a ne'er-do-well by simply having his discharge put in his hand, which is endorsed with the somewhat indefinite statement, 'Services no longer required,' and ordering him to be walked out of the barrack gate. Excepting troopers who have contracted chronic bibulous habits, a good deal is condoned in respect of offences purely military. But the weeding-out process is rigorously resorted to should a man get himself into any trouble with the civil authorities outside, in a way likely to affect the high character of his corps. Then off he is packed with but scant ceremony. Thus each man who has put in his twenty-one years must of necessity have been of steady habits, and such characteristics he generally imports into civil life. A few men after discharge may go to the bad; but it is safe to say that a good ninety-five per cent. of those pensioned cuirassiers are men of unexceptionable respectability. Several—usually men of advanced age, who are incapacitated for work, and have no income but their meagre pensions—wisely seek refuge within the sheltering walls of Chelsea Royal Military Hospital.

The average ex-life-guardsman retains a fondness for porter, a humble beverage, that to him conjures up many reminiscences of his rollicky experiences of the canteen. He usually imbibes in moderation, however, unless when he meets an old comrade, or indulges in an excusable outbreak on pension days. Though not an active politician, he, like most retired warriors, has a distinct leaning towards Conservatism. For him former associations possess a perennial charm. If opportunity permits, he loves to witness any State procession at which his old regiment is on duty. His position as an irresponsible onlooker is unique and delightful, and when the affair is over, he turns away with presumably the satisfactory knowledge that he is exempted from a good four or five hours' grooming and cleaning.

The majority of pensioned cuirassiers—though originally they may have been recruited direct

for the Household Cavalry from all parts of the three kingdoms, or have been transferred from marching regiments, as many men are who are physically eligible—remain in London. Probably in the metropolis they have more immediate chances of employment on being discharged. Again, being mostly hampered with families, difficulties are thus thrown in the way of going afield to seek their fortunes.

There is but little intercourse between ex-members of the different regiments in the brigade of Household Cavalry, possibly because they saw comparatively little of each other during their term of service. But the men of any one corps are very gregarious. If they are too far apart to forgather in any particular inn, they are sure to meet in the canteen some time or other when the old regiment is quartered in London. The parchment certificate of discharge also places non-commissioned officers and troopers on a level, socially speaking. Thus, close friendships are often subsequently formed between the pensioned representatives of those grades, which, by reason of the restrictions necessarily imposed by military discipline, had been made impossible while they were on the active strength.

THE MONTH:

SCIENCE AND ARTS.

THE Zoological Society of London has received from Professor Stirling, of the university of Adelaide, a water-colour drawing of the newly discovered Marsupial Mole ('*Notoryctes Typhlops*'), and the picture is on view at the Society's library. Only two or three of these curious animals have as yet been found, for they seem to be confined to one district, are extremely difficult to track, and can only be found after rain, when the sand is moist enough to retain the markings of their feet. Very few white men have ever seen this strange creature, whose business in life seems to be perpetual burrowing. Professor Stirling says that 'in penetrating the soil, free use as a borer is made of the conical snout with its horny projecting shield, and the powerful scoop-like claws (fore) are also early brought into play. As it disappears from sight, the hind limbs as well are used to throw the sand backwards, which falls in again behind it as it goes, so that no permanent tunnel is left to mark its course.' The drawing of this animal, the discovery of which is one of the most important made in recent zoology, is to be brought before a meeting of the Society later in the year.

The Electrical Exhibition, to be opened at the Crystal Palace in January next, promises to be the most complete display of its kind which has ever been known. It will be International in character, and will include in its sections everything which has the remotest connection with electrical science. A most complete collection of instruments illustrating the history of the electric telegraph from its first inception to present times will be shown by the Government,

and this part of the Exhibition will be arranged under the direction of Mr W. H. Preece.

At the 'World's Fair' at Chicago it has been decided that the various buildings shall be decorated with a composition known as 'Staff.' This is a mixture of plaster of Paris, alumina, dextrine, and glycerine, is of French origin, and was first used at the Paris Exhibition of 1878. The various constituents are mixed, like ordinary plaster, with cold water and allowed to harden in moulds. The composition is quite waterproof, and to correct any tendency to brittleness the castings are backed by some textile material such as coarse canvas. The colour of the material is dirty white, but it can of course be tinted to any hue that may be required.

Some interesting particulars regarding the ostrich are contained in a paper recently read before the Royal Society of Tasmania by Mr James Andrew. During the nesting season, the male bird is so pugnacious that it is dangerous to go anywhere near him. His method of attack is by kicking; and as his powerful foot is armed with a formidable nail, he can do great damage by bringing it down upon his opponent. A blow with the flat of the foot is terrible enough; but the nail has a ripping action which is far worse. Instances are adduced where a man has been killed by one blow from this awful foot; and in another case a horse's back was broken by a blow aimed at its rider. When a man is attacked, it is useless to seek safety in flight, for the bird can overtake him in an instant. The only way is to lie down flat on the ground and take the punishment until chance offers an opportunity of escape. If the bird is seized by the neck and his head tightly held down, he is rendered comparatively powerless.

An American paper recently published an interesting article on 'The Colour of Snakes as affected by Climatic Influences.' From observations made, it would seem that the colour of these reptiles will always partake more or less of the natural tints around them. Thus, when the soil is of a reddish colour, the diamond rattlesnake is reddish in his markings, and of far lighter hue generally than the same snake found in the dark woods of Demerara. The puff adder gives us another example of colours coinciding with local tints, for when this deadly creature finds its home upon the lower lands near the sea, it is pale and dirty-looking. Not so, however, when it comes from the higher ground, among more brilliant surroundings, for here he appears in the brightest yellow and black which can be conceived. The pattern upon the skin of each species seems to be preserved, and it is the colouring only which varies with locality.

Hydrofluoric acid is the agent commonly used for etching glass, and for giving it that ornamental frosted appearance which is so commonly seen in the windows of offices and public buildings. But the acid has a most deleterious effect upon the health of the workmen employed in glass factories, unless special precautions be taken to carry away its fumes. The harmful effects produced by the acid vapours are exhibited in attacks of vertigo, malaise, and dyspepsia. At certain works under the supervision of the factory inspectors of Grätz, the workmen have repeatedly

complained of illness; and inquiry proved that the precautions taken against inhalation of the acid were not sufficient. Each man worked with india-rubber gloves, and with hands inserted in a box furnished with a pipe to carry off the noxious fumes; but the heavy gas was found to collect in the workrooms in spite of this device for its extermination.

In the year 1857, the French engineer, M. Jus, demonstrated that that portion of the Sahara Desert included within the area of French Algeria contained large underground supplies of water; and the number of wells bored since that time in the departments of Algiers, Oran, and Constantine amounts to more than thirteen thousand. These wells vary from one hundred to four hundred feet in depth; and the pressure of the water forces it a couple of feet above the surface of the ground. It is then led into ditches, and is carried in this way to the vineyards, date-trees, and wheat-fields. No fewer than twelve million acres of barren land have been made fruitful in this way, an enterprise representing perhaps the most remarkable example of irrigation by means of artesian wells which can anywhere be found. Algeria owes to this method of cultivation that it is becoming a most important wine-producing country, as may be gauged from the fact that it sent to France in 1886 ten and a half millions of gallons.

It is an unavoidable feature of war-ship construction that a new design quickly becomes obsolete, and as a matter of course there are always a number of ships on hand which in the case of war would be quite eclipsed by more modern patterns. Captain Cressy, R.N., has made a suggestion to the Admiralty regarding these vessels, which seems to be worthy of consideration. He proposes that, instead of breaking up these iron-plated monsters when they are condemned as being unfit for further service, they should be utilised in the construction of breakwaters. The vessels could be filled with heavy concrete or other material at the point where the breakwater was required, and sunk so as to form a base around which further construction could be carried out. We presume that the acceptance of the proposal would be determined by the value of the materials comprised in a ship of this type.

A simple method of cleaning plaster busts and statues has lately been published; but it is applicable only in those cases where the plaster has not been painted, waxed, or treated with any other impervious coating. The article is inverted and filled with water, which gradually percolates through the plaster, and carries all dirt from its pores, the action being helped by washing the surface with water and a soft brush. The plaster is soon restored to its original whiteness, but to secure this result, the water employed must be quite free from iron.

There have been published within the last few years numerous alleged cures for consumption, and the last one—Koch's tuberculosis remedy—has given rise to an immense amount of controversy. But prevention is always better than cure, and those who unfortunately feel an active interest in the subject, either on their own account or because of some near one, will do well to study the remarks of Mr G. W. Humbleton at the

recent meeting of the British Association. This gentleman pointed out that this disease of civilised life was produced by causes which tended to reduce the breathing capacity below a certain level. To avoid it, the work which the individual had to perform should be carried on under conditions favourable to the body. Every effort should be made to develop the lungs, both by athletics and active exercise in the open air. Occupations which involved stooping and cramped positions should be avoided, and corsets and tightly-fitting garments discarded. Close and badly-ventilated rooms, especially sleeping apartments, are pronounced against; wool should be worn next the skin; the body should be held erect; and deep inspirations in breathing should be taken through the nose. This is valuable advice; but it is difficult to persuade others to avail themselves of it. Among many classes, the fresh air of heaven is too often shut out as if it were a dangerous poison.

An American physician advocates the vapour of vinegar as a valuable remedy in croup. The liquid is put into a pan, placed on heated bricks or irons, so that the air of the sick-room becomes speedily saturated with it. This seems to be a partial revival of old ideas, for the vinaigrette used to be commonly carried by ladies as a remedy against faintness. But it may possibly be serviceable in the new way indicated.

'The harmless necessary cat' is just now in rather bad odour with a member of the Zoological Society of France, who has recently called attention to the serious diminution of birds in that country through the depredations principally of pussy. Of course, boys must be credited with a great deal of the mischief; and the hedgehog, squirrel, dormouse, and other natural assailants of birds must also receive their fair share of blame. But the cat is the worst offender of all. On a certain estate where thirty-seven birds' nests were watched, only eight produced a brood of young, fourteen of the twenty-nine destroyed falling to the hunting propensities of the cat. A tax on cats would perhaps have the effect of weeding out a few of these marauders.

Those with only an elementary knowledge of chemistry are aware that there are more than forty recognised metals. A large number of these can only be regarded as curiosities of the laboratory, for there is no specific use for them; indeed, they are found in nature in such minute quantities that some of them are far more precious than gold. Among these rare metals is wolfram or tungsten, a use for which has been found since guns of enormous calibre came into vogue. It is unfortunately a matter of common knowledge that these guns are liable to fracture; but it has been found that by adding a very small percentage of tungsten to the fine steel of which the inner lining is made, an elasticity is conferred upon the metal which it did not possess before, so that it will bear alternate expansion and contraction under heavy charges without giving way. Tungsten is a white metal of very brittle quality, and its specific gravity is only a trifle less than that of gold.

It is reported that the astronomers at the Lick Observatory, who have at their disposal the largest telescope in the world, have detected certain appearances on the moon's surface which have

never been seen before. A luminous spot, for example, which appears on one of the lunar mountains has an exact resemblance to snow; yet the orb has always been regarded as a dead world without atmosphere, and snow would under such conditions be impossible.

A preparation of eucalyptus, consisting of a mixture of certain antiseptics in the essential oil of the plant, and known as 'Tucker's Eucalyptus Disinfectant,' is highly spoken of by a medical writer in *Nature*. He says that for the past two years he has used this preparation in all cases of scarlet fever and diphtheria, rubbing the disinfectant over the whole body twice, and then once a day for ten days, and has not had one case of infection. He also gives the experiences of other doctors in confirmation of his own, and tells how in one instance a child having scarlet fever and treated in this way failed to infect two healthy children who for eight days occupied the same room with the little patient. The two diseases named are so justly dreaded because of their fatal nature, and also because of the mischief often left in their train, that we have no hesitation in giving publicity to this statement.

The Antirabic Institute at Padua is, as its name implies, an establishment for treating those who have been bitten by rabid animals according to the method introduced by M. Pasteur. There have been so many conflicting statements made as to the efficacy of M. Pasteur's system, that some interest is attached to the Report for 1890, which has recently been issued by the Institute in question. It seems that during a period of seven months the total number of patients treated numbered forty-nine. Twenty-three of these unfortunates were the victims of animals proved, by experimental inoculation, to be rabid; eighteen had been bitten by animals certified by veterinary surgeons to be so; while the actual condition of the animals which originated the remaining eight cases could not be traced. Not a single death occurred among the forty-nine patients; and there was every reason to suppose that they had, under treatment, become perfectly well.

More than once have we adverted to the pneumatic system of propelling dynamite shells, which, originally invented by Zalinski, has been adopted in principle by others. A dynamite torpedo-thrower of this character is shortly to be erected on Dale Point in Milford Haven. The entrance to this natural harbour has a breadth of two miles; and the pneumatic gun can be laid so accurately that it will be possible to drop a charge of three hundred pounds of dynamite upon any hostile ship which comes within range. This terrible weapon has already been tried at Shoeburyness, when it was found that shot after shot could be dropped into a predetermined area covering only two or three yards. This reversion to the old mortar system of attack is both curious and interesting.

The beautiful colour known as Alexandrian Blue, which was commonly used by the Romans in painting their frescoes, has proved to be what drapers call a 'fast colour,' for it has in many cases stood with its lustre undimmed for a couple of thousand years. In many of the Pompeian houses, for instance, this colour is found in the mural paintings. Many attempts have been made,

after analysing the colour scraped from these walls, to reproduce it synthetically; and at last a French chemist, it is said, has succeeded in making it from its constituents, principally silicate of copper and carbonate of lime. The new manufacture is presently to be introduced as an article of commerce.

A novel kind of circular saw has been patented by Mr J. E. Bott, and introduced commercially by the Planing and Saw Company of Manchester. The saw differs from one of the ordinary kind in having its teeth alternated with planing-knives, so that as a plank is sawn asunder, the two new surfaces, instead of being left rough and scored by saw-cuts, are accurately levelled as if by a smoothing-plane. The work of a separate planing-machine is thus dispensed with, and the wood is delivered ready for polishing, after being subjected to the usual rubbing with glass-paper.

The remarkable way in which both dogs and cats will find their way home from long distances has formed the subject of many an anecdote, and most persons can recall instances of this remarkable faculty on the part of domestic animals which have come under their own observation. It is not generally known that the fox also possesses this power of finding its way back to its usual haunts. But a well-authenticated instance of the kind is quoted by Mr Harting in an interesting article in the *Zoologist*. He tells of a fox which returned three several times to its 'earth' from a place seventy miles distant. The animal was caught in Yorkshire, and sent to be hunted in Lancashire, the catcher having marked it in the ear, so that there was no doubt as to its identity.

Mr Galton's Anthropometric Laboratory, which was visited by so many persons during the Health Exhibition in London, has now found a new home in South Kensington Museum, the old site having been required for the Imperial Institute. Its work, without leading to any remarkable result, has been extremely useful; but it is curious to learn that a false standard is liable to be raised, which may in the future embarrass those who pass candidates for the public service, in consequence of the results of what may be called human vanity. Those who are proud of their strength and general physique are rather fond of testing their powers, and obtaining official records of the same, while narrow-chested and weaker mortals do not care to have a demonstration made of their feeble efforts to come up to the average. Hence a misleading standard is likely to be arrived at, which militates against that accuracy which Mr Galton endeavours to secure.

At the late Congress of Hygiene and Demography, an interesting paper was read by Dr W. Anderson on the Revolving Purifier for treatment of potable waters by means of metallic iron. This apparatus, invented by Dr Anderson, has been in use for some years, so that he was able to deal with the results gained by the use of the contrivance in different localities. The Purifier consists of a revolving cylinder, partly filled with scraps of iron, which, by constant attrition, keep perfectly clean. The water to be purified is passed through this cylinder, and in the process, takes up from one-tenth to one-fifth of a grain of the metal per gallon. This iron is afterwards got

rid of in a settling reservoir, or by rapid filtration through sand, and with it are eliminated organic matter and other impurities which may originally have been present in the water.

THE INDIAN CROW.

HE wears the outward semblance of the common jackdaw, and his disposition is somewhat similar; but the most abandoned jackdaw that ever flew is a model of probity and virtue by comparison with the gray-headed reprobate we call a Crow. The English bird has defective ideas regarding ownership, and is admitted on all hands to be a noisy and undesirable neighbour; but his shortcomings and faults are as nothing in the eyes of him whose fate it has been to make acquaintance with the Indian Crow.

A kleptomaniac by birth, that crow makes theft his profession from the hour he leaves the untidy nest in the mango tree, wherein his parents reared him on stolen goods. From the hour he can use his wings he pursues a career of audacious wickedness which would shock a jackdaw into honesty. His character is blacker than his wing. He lives by peculation and larceny, purloining from man and beast alike. He revels in cannibalism, stealing the fledglings of other birds, and tearing them limb from limb to devour while the blood runs warm. He has not a friend in the world; every hand, every tooth, and every beak is against him, and he glories in it; comporting himself with a brazen sprightliness that the guileless robin would blush to see. In the boundless jungles he might dwell in peace, and earn an honest livelihood, so he does not live there. He prefers a life of dissipation in town, and rears his family in the trees lining the busy bazaar, conscious that the mild Hindu will not only leave him undisturbed, but find, unintentionally, a living for him. He never strays far from the haunts of mankind; the poor black man's rice and chupatti are sweeter to him than the growing fruit and grain; and he does not disdain to swindle the hungry pariah dog out of his inheritance of garbage. He is omnivorous and insatiable, combining the appetite of the vulture with the tastes of the ostrich: nothing comes amiss to him; one minute he steals the toast off your breakfast table, and the next is one of a party discussing a dead rat.

Look at him as he perches there on the veranda railing. His legs are bent, his wings are half open, and his body thrust forward in readiness to take the instant flight for which his uneasy conscience warns him always to be prepared. He carries his head on one side, and his beak agape; his wicked eye is restlessly rolling; he looks exactly what we know him to be—to wit, a bad, bold, evilly-disposed bird. He is on the railing for no good purpose; he never went anywhere yet on an honourable errand, and he never will. He is waiting until your back is turned to drop noiselessly in at the open window, thence feloniously to steal and carry away your pen, shirt studs, money, or penknife; no matter what, so long as it is something loose and portable, which you want, and he does not. He purloins from sheer superfluity of naughtiness, for in nine cases out of ten he leaves his booty on the most inaccessible part of the

bungalow roof, after subjecting it to a cursory examination; and in the tenth case he drops it down the well, pretending to do so by accident. As soon as he has thus disposed of your property, he comes back to the veranda for the express purpose of hearing you scold your 'boy' for losing an article he never touched.

The black servant hates the crow with a deep undying hate not unmixed with awe, for he regards him as the abiding-place of an evil spirit. Cynical persons of broad views have been known to say that dishonest nokkurs become crows when they die; and certainly the bird's close intimacy with the minutæ of Anglo-Indian housekeeping gives the theory plausibility. This, by the way. I was about to refer to the boy's practice of saddling his own misdoings upon the crow. Anything bright and shining, like a silver spoon or gold stud, has an irresistible attraction for the crow, and the boy knows it; indeed, what a native servant does not know is not worth learning. Hence, when such an article mysteriously disappears, as things do disappear in the East, the boy always 'saw crow done come took it.' A crow once took away four of my table-spoons in this fashion; but very kindly brought them back and laid them in a drawer of the table in the back veranda, when he discovered that they were electroplate of inferior manufacture. I mention this as an exceptional case. Both the khitmugar and mesalchee recollected seeing the crow carry off those spoons, but could not remember seeing them brought back, though they agreed with me that it must have taken the bird some time to open the drawer and shut it again. Needless to say, the crow never goes to the trouble of restoring anything that is convertible into annas and pice in the bazaar.

But inasmuch as the hard-hearted European sceptic insists on holding his poor black servant responsible for the crow's misdeeds, and docks his monthly wages in accordance with this principle, native ingenuity is ever on the rack to devise means of circumventing the enemy. The bird's cunning is so extraordinary that no ordinary trap deceives him, and the boy has recourse to all kinds of dodges to accomplish the desired end. Sometimes he makes a few strong paper cones, and smearing them inside with birdlime, drops a morsel of juicy raw meat into each, and throws the snares down on the rubbish heap behind the cookhouse where crows do mostly congregate. Down comes a crow to investigate; he turns over a cone thoughtfully, and applies his eye to the interior. Meat, by all that's edible! In goes his beak, and he is securely 'bonneted.' Before he can claw off the encumbrance, the wily native is upon him, and he is borne struggling and squarking into the smoky cookhouse. There the boy squats on the floor and holds him tight, while the bobachee fastens a cork upon his nose with a bit of wire from a soda-water bottle; and thus adorned, he is released, to wear a badge of shame for the rest of his days. Being caught by the superior craft of man is the only thing a crow is ashamed of. But he does not live long if there happen to be a 'griffin' in the district; the new arrival recognises in the strange excrescence the distinctive mark of a new and curious species, hitherto unknown to natural history; and, fired

with scientific zeal, shoots him accordingly. It is an expensive mistake—for the crow.

But so admirably is the crow 'Intelligence Department' organised, that the most subtly designed trap soon fails to delude. The corked example, for instance, goes about, a melancholy warning against the allurements of paper cones, and tells every fellow he meets how he came by the decoration. Thenceforth, those instruments are doomed to failure and derision; you may spend a lifetime making paper cones and charging them with the choicest dainties, and the crows will come and sit round, squarking sarcastic remarks. If you leave the snares long enough, the birds will calmly set to work and take out the bait from the apex end in safety; but no appeal to the crow palate will induce them to fall in with your scheme.

The intelligence of an elderly crow is exasperatingly human. Point your gun at him and he seems to vanish into thin air; in reality, he has dived behind the nearest cover like a flash of black lightning. Threaten him with the unmounted barrels, and without stirring a feather, he croaks back a jeering 'squark.' He regards a hand-thrown missile with utter contempt; waiting until it is fairly launched, he calculates its course with mathematical precision, steps aside to let it pass, and resumes his old perch, yawning.

Crows are intensely clannish. If you are consumed with a morbid curiosity to ascertain how many reside within a radius of five miles round your bungalow; or if you conceive a philanthropic wish to relieve your neighbours of their share of the crow population, it is very easy, once you have caught a member of the race. That, I admit, is difficult. But assuming that you have succeeded, all you need do is, tie a red rag to his leg and let him go. In three minutes all the crows in the district have heard of the outrage, and the air over your compound is darkened by thousands of angrily protesting birds—all crows. Other feathered creatures ignore the carryings-on of this disreputable family. It is an indignation meeting, called to condemn you; and the crows, flying just out of gunshot, hurl down unanimous and deafening votes of censure with all the power of their lungs. If you appear outside for a moment, the uproar becomes positively bewildering; all you can do is to remain quiet indoors and wait. Presently there is a lull; this denotes that a committee has been appointed to examine your victim, and that the business is in progress on the top of a high tree. It is a crow Supreme Court of Judicature, and only two methods of procedure are known to it: if the rag can be pecked off, the committee crows remove it; if it can't, they lose their tempers, swear that the rag-adorned crow has himself to blame for his misfortune, and kill him out of hand. This done, the meeting, which has hovered in waiting, bursts forth in votes of still more vociferous censure, and breaks up. Then you venture forth, feeling like a man who has passed through an Indian thunder-storm and an earthquake rolled into one.

I have already mentioned the crow's taste for young birds; and there is in this nothing very remarkable. A half-fledged sparrow is a tender and succulent morsel no carnivorous bird need despise. But what, in the name of gastronomy,

is there to recommend the scorpion as an article of diet, even to the depraved appetite of a crow? And yet his fondness for this ugly reptile amounts to a passion. If you see half-a-dozen crows standing silently in a circle on the road, you may be sure there is a scorpion in the middle, lashing out on all sides with that dangerous curved spur which forms the extremity of his tail. Stand still and watch the one-sided strife. One crow takes his place in front of the reptile, to engage his attention; the rest hop round, seizing every opportunity of giving the ever-moving tail a vicious dig. The scorpion is scaly and tough, and surprisingly active, so it takes some time to disarm him; but his strokes grow fainter and fewer, and the crows' digs harder and more frequent. At last a well-aimed peck strikes home between the overlapping armour, and the tail is severed. It's all over; as the spur and its underlying sac of poison fall off, every beak closes on some portion of the scorpion's anatomy, and a tug of war ensues, 'all against all'; it is torn to pieces and swallowed on the spot.

I saw, early one morning, a very curious contest between a number of crows and a bandicoot rat. The rat had obviously been out all night, and was making his way home along a shallow open drain, when the crows caught sight of him. He was a sorry specimen of his kind; mangy and decrepit, so the crows 'went for him.' A bandicoot's teeth are long and sharp, and the birds were not inclined to come to close quarters in the open; they formed up in single file on either edge of the drain, and escorted the now hurrying rat till he reached his hole. Then they began operations; the instant the bandicoot's head disappeared they fell upon him pell-mell, and drove their iron bills into every tender spot they could reach, while one of the flock held on to his tail, seemingly bent on dragging the owner out. Whether the strain on his caudal appendage overcame him, or whether prompted by motives of vengeance, I cannot say, but after a few seconds' struggle, the bandicoot backed out and snapped fiercely at his foes, who retreated a step or two and waited. The crow at his tail was the first to retire; and giving it a defiant waggle, to make sure it was free, the rat made another rush for his burrow. The very moment his head was out of sight, a crow pounced upon his tail again, and the others resumed the attack, drawing blood at every peck. I began to understand the *modus operandi*, and grew interested: the crows' plan of action, in detail, was to assault only when the rat could not bite back; and the general idea to worry him until he succumbed to exhaustion and weakness. It took the birds just twelve minutes to achieve a victory; the bandicoot grew weary, and presently the crows confined themselves to simply dragging him out whenever he got half-way into his hole. As soon as it appeared safe, they pounced upon him *en masse*, pecked out his eyes, and literally stabbed him to death. Then, in half the time it had taken to kill him, they ate him and flew away happy.

People who don't know the crow may find difficulty in believing the following anecdote, though Anglo-Indians will accept it without hesitation. A dog of my acquaintance—a fox

terrier of long Eastern experience—was one morning eating a chicken-bone on the veranda, when two crows happened to pass, and, observing the dog and his bone, wheeled down and alighted on the veranda railing, whence they set to work croaking to induce him to drop his breakfast. Under ordinary circumstances, an English dog will fly at a crow the moment he appears; but on this occasion 'Jack' simply looked up, growled, and continued gnawing. The crows ceased croaking, and consulted together for a moment; then one of the pair dropped into the veranda a few yards behind the dog and croaked at him again; once more obtaining no answer but a growl. After strolling casually round the veranda for a minute, to let Jack settle down, the bird hopped up silently and swiftly and gave the dog's tail a cruel nip. That was too much; with a howl of pain, Jack turned upon his tormentor, and crow No. 2, who had been patiently awaiting this opportunity, swooped down upon the bone and carried it off. You never saw a dog wear a look of such abject humiliation as did Jack when he recognised how he had been fooled.

When Nature organised her great scheme of administration, she appointed the crow to the Sanitary Department, with the jackal, pariah, vulture, and kite. These four are conscientious and painstaking officials, whose utility no one denies; but after all I have said about the crow, it seems idle to add that he never does any work, or only when it happens to suit his private ends. So far his chief purpose has been to supply us with a synonym for wickedness and cunning, and our servants with a scapegoat; but he is scarcely worth preserving for these uses. Not that he stands in need of preservation or in any way owes his flourishing condition to protective effort on the part of man. He is only too well able to take care of himself; indeed, if there be anything in the doctrine of the 'survival of the fittest,' a time should come when the crow, and the crow only, will populate the world.

TWO LITTLE FEET.

Oh life, so prodigal of life!
 Oh love and destiny at strife!
 Oh earth, so full of busy feet!
 Oh woods and hills and all things sweet!
 Was there no room amidst you all
 For two more feet, so soft and small?
 Didst envy me, where thousands sing,
 The one bird that made all my Spring,
 My dove, that had so many ways
 Of making beautiful life's days?
 No room! Or rather it may be
 Earth was too small t' imprison thee.
 God only knows. I know I miss
 Thy sweet caress, thy loving kiss,
 The patter of thy dear small feet,
 Thy hand in mine through lane and street;
 While all that now remains to me
 Is just a precious memory.
 Two little feet 'neath earth's brown sod,
 Two white wings somewhere safe with God.

THE SCIENCE OF SOCIETY.

By MRS LYNN LINTON.

NOT every one who gives fine dinners and grand entertainments understands the true Science of Society—for indeed it is as much a science in its own way as some others of more imposing name and important general results. The faculty for this scientific arrangement of society is partly innate and partly cultivated. It is one of those mental operations which, in the higher reaches of intellectual life, we call genius—so swift the flash of perception—so untranslatable the stages of thought by which the whole bearings of a thing are understood and transferred to action. A person gifted with this faculty knows, but could not explain why, such and such persons would not suit as fellow-guests at the same dinner-table. They are of the same social standing; there is no feud between them; they do not fight under different banners, and for the matter of that they do not fight under any banner at all, being supine and neutral; there is no reason why, so apparent that it ‘leaps to the eyes,’ and yet those two, asked at the same time, would mar that harmony of relation which every intelligent hostess feels and after which she strives as much as she strives for beauty of decoration and carefulness of cookery. Perhaps the one lady paints, dyes, and blackens, and the other wears high necks and is prim; perhaps the one man has a loud laugh and a harsh voice, and the other has delicate nerves and a fastidious ear; perhaps the gowns of Mrs A. are made at home after her own quasi-aesthetic and wholly eccentric patterns, while Mrs B. gets hers from Worth, and is always in the very front rank of the fashionable squadron. Things as shadowy as this may be the cause—things which no one would see but a hostess gifted by nature with the social faculty which she has sharpened by cultivation; but to her these small kinks are quite enough to mar the weaving of a smooth web, and she gives no second thought to the collocation of these two

slightly inharmonious tints—these two faintly jarring notes. A hostess of a different stamp would have huddled the two together—for the result of a mutual tilting of noses and a general sense of misfit.

Some women, who yet entertain a good deal, never give themselves any trouble to arrange their guests according to the laws of social harmony. They bracket together the most pronounced incongruities, and give no heed to the pleasure or displeasure they create. Their dinners are social debts to be paid with sprawling, clumsily-written cheques; and their harmonies are on a par with the barrel organs in the streets. They will give the most insignificant little scrub to the woman who holds herself as the *prima donna* of the *festa*; and to the finest and most distinguished old man they assign the newly introduced daughter of the house, who has no thoughts, no ideas, no education, and no wit—and, worst of all, no beauty to make up for all this lack. Beyond the broad, blunt-edged perception that a lord counts before a commoner, their knowledge of the order of precedence does not go. All the finer distinctions are lost to them; and between the Squire of his own parish, lord of all men when he is at home, and the young attorney, whose nets are spread in vain in the sight of all birds, they know only that the one has money and the other has not, and that really now, money is not merit, and shall not rank as merit with them! These are the women who offend more than they gratify by their dinners; and from whom at last the wary shrink, sure as they are of some inappropriate association—some humiliating assignment—which will rob the hours of all pleasantness and the dinner of all grace.

In the way of the material, too, some of the obtuser kind sin quite as deeply as in the order of association. In certain houses the meal lasts over two hours with a profusion of dishes that creates satiety by the very length of the *menu*. The impression left is that of a barbaric kind of excess, wherein are lost the very elements of

beauty and the first beginnings of good taste. The succession becomes wearisome, irritating, and at last revolting. It is waste, not plenty—ostentation, not hospitality—vulgarity, not splendour. To this overplus of material you almost prefer that opposite extreme which asks a party of eight to cold roast beef as the *pièce de résistance*, and which counts the potatoes with anxious regard not to exceed in number the mouths they are to fill. Both kinds are fatal to the science of dinner-giving; and both kinds are to be found in London and all large cities, where opulence now gives itself the airs of princely and unapproachable splendour, and now the false seeming of such simplicity as, in one of less well-known wealth, would pass for griping meanness. To these mistakes add the frog-like endeavours of the comparatively poor who buy at the confectioner's, and hire from the greengrocer's, dishes and aid they cannot supply from their own establishment; by which they give an expensive and pretentious dinner that pleases no one and that cripples their own resources for no good result whatever. How delightful the contrast to this when we light on a sensible, painstaking, and harmoniously minded hostess, who asks a few well-chosen people to a small, simple, well-cooked dinner, served without hired help, and all well within the means and appliances of the household! Such a dinner as this is one of the most delightful to which one can be invited. It is true hospitality; and an evidence of scientific culture that takes the blue ribbon on the spot.

If there is a science in dinner-parties, so is there in those larger evening gatherings where, however, the boundaries are considerably enlarged, and the charter of acceptance is much more catholic than with dinners—enlarged and more catholic even in those houses which profess to be eclectic and select. With those which are as free as caravanserais, the ordinance is different, and the result not always satisfactory. Those very ecumenical gatherings are apt to leave on you the impression of a rabble, a muddle, a menagerie, rather than a harmonious mingling together of human beings bound by like ties into some sort of compact organisation. The notorious *divorcée* and the latest *débutante* with the bloom still on her fresh young cheek and her white soul as pure as snow; the man who has run away from his wife and the wife from whom he has run away; the critic who under his own name has savagely attacked an author and the author whom he has pulverised, chopped up into mince-meat, and incontinently done for; the young 'scion' who loved and rode away to the brisk tune of so much damages for breach of promise, and the forsaken maid who has had to sing 'Willy waley O!' instead of 'Fal-lal-la'—these are not harmonious ingredients for the same slice of social pudding; and a more delicate discrimination—a more scientific classification—would have been better. Such hostesses, however, may aspire to the title of catholic—taking society in a very big net with very small means, and not disinclined to be known as all-embracing. But it was a better kind of thing when such a house as that of Mr William Spottiswoode opened itself to one side of 'all London,' but that side so fine, so superior, so distinguished, as to make it in a certain sense an honour to be seen there. The

roses were so many and so fragrant that all the pots took part of their perfume to themselves! This was one of the most notable salons of its day in London—as famous in its own way as was the Hôtel Rambouillet—that archetype of a perfectly conducted drawing-room. Sir Charles Babbage, too, held a distinctive salon, the aim of which was distinguished men and beautiful women; and Miss Berry's, and Holland House, with Lady Palmerston's later presentation, are chapters of what is now ancient history.

The success or failure of all gatherings, whether in the wider evenings or the more selected dinners, depends on the hostess. Mainly, if not wholly, it is she who causes the thing to go well or to make shipwreck on the rocks. If she is fussy and interfering, thinking it her duty to interrupt all pleasant tête-à-têtes and break up and scatter to the four winds all happy little conglomerates, she does more harm than those of the sluggish kind, who invite their guests haphazard, as a fisherman casts his nets, and then does not take the trouble to assort according to size and value, but lets them all flap and flounder in the basket together. A very fussy hostess is an infliction to be warily avoided by those who understand the pitfalls as well as the rose-banks of society. Not for ill-nature, but rather by a curious kind of indiscriminate good-nature, she destroys the comfort and disturbs the happiness of every one on whom her restless eyes may fall. The well must always be made better; the contented must be the delighted. Hence she spoils the already sufficient, and destroys the perfected, through her restless desire to effect new combinations that shall be—and never are—superior to the old. She comes down like a whirlwind on Edwin and Angelina, and, in the mistaken idea that she is catering for the pleasure of each, hurries the one off to Julia, and brings to the other Alfonso, both of whom want nothing so much as to be left in peace together. As if stung by some upsetting gadfly, she routs out all the comfortable inhabitants of cosy corners, and breaks into the earnest talk of two friendly metaphysicians, two enlightened politicians. Dear soul, she means it all for kindness! So perhaps does the whirlwind when it comes sweeping over the young plantations and across the tender seedlings, uprooting, dispersing, and carrying to new quarters the shy little growths which wanted only to be left in peace where they were.

Contrasted with her stands the supine hostess, who does nothing for the better arrangement of chance combinations or for the ease, amusement, and well-being of her guests. She introduces no one, looks after no one, takes no heed to this one's boredom, to that other's neglect. Under her slack management a pretty woman may sit alone and unnoticed for want of that first stirring of the stagnant waters which would make the masculine atoms crystallise round her, according to their natural law, if but the first impulse were given. As it is, the pretty woman sits alone, inwardly chafing, outwardly frigid; and when she leaves the assembly where she has emphatically failed to receive the tribute due and generally paid to her, she leaves it dissatisfied and in an unfriendly mood towards the hostess, who, had she mastered but the mere elements of her

science, would have given to each and all a brilliant hour and not a desolate one.

The most charming of all possible réunions are those where the members are few and the guests well assorted. This does not imply sameness, but the contrary. Harmonies develop out of varieties, and you can scarcely call a monochrome a harmony in colours. An evening made up of all stars would be the dullest thing of its kind. Stars need an audience; and rivals do not make the most sympathetic listeners one can imagine. On some Sunday afternoon in London you may happen on a small knot of superior men gathered round the fireside of a certain wide-minded woman. Here the leading politician lays down the chart by which the greatest artist of the day is to steer his own small political skiff; and there the artist informs the statesman of the right view to be held about the new purchase in the National Gallery, the Old Masters or the modern school. The poet, whose eyes look round the corner for the laurel wreath of the future, learns the outlines of the last new discoveries in biology or chemistry; and the Theosophist settles the previous incarnations of the whole roomful to his own satisfaction if not to their conviction. These chance harmonies by contrast are infinitely better than the monotony of repetition; and so the wise hostess knows, and on this knowledge she acts, when she chooses her guests and arranges them according to the social diatonic scale. Whence flows the sweetest kind of social harmony, and the entire absence of every jarring note that might disturb the melody.

A SOLDIER AND A GENTLEMAN.*

By J. MACLAREN COBBAN,
Author of *The Cure of Souls*, *Tinted Vapours*,
Master of His Fate, &c.

CHAPTER VII.—THE MISSED ASSIGNATION.

WHEN the ladies withdrew, Ferrers held the door open, and Dolly passing out last whispered to him: 'Don't be long; I want to talk to you.'

He had barely sat down again when Mr Drew posed him with a question. 'Do you mind telling us now what was that nickname with the initials "G. F."? I've been trying to guess, and—well, I don't think I can, unless it's'—

'Stop a moment,' said Mr Drumly, interrupting him with a laugh; 'I want to have a guess, too. Suppose we write our guesses down and hand them to Mr Dawlish?'

That was agreed to, and done.

'No,' said Ferrers, when he had looked at them; 'both wrong. But I tell you what,' and he laughed. 'You'll be here for a week—is not that so?—and you can have a good spell at guessing. Whichever guesses right shall have all my sketches.'

The proposal was hailed with laughter and welcome.

'Won't you have a cut in, Sir William?' said Mr Drew.

'No,' said Sir William promptly; 'I think not. It wouldn't be fair, because I believe I know the nickname.—Shall we join the ladies?'

When they went to the drawing-room, Ferrers

looked out eagerly for the expected opportunity of a talk with Dolly; but Miss Dawlish kept such dragon-guard over her that he could say nothing of any private significance.

'I didn't know, cousin,' said Dolly, 'that you could draw and paint so beautifully. I wish you would teach me.'

'I will gladly,' said Ferrers.

'Let us look at your sketches again;' and she rose quickly and crossed to the table where they lay.

But Aunt Dawlish was equal to her move. 'Yes,' said she, 'they are lovely—aren't they! And so spirited.' And she took Dolly's arm with great show of affection and accompanied her to the table. Other attempts of Dolly to detach herself from her aunt fared no better.

Presently, Sir William suggested that the gentlemen should go to the billiard-room, while the ladies talked of going to bed. Ferrers was doubtful what to do: if Debrett had been present, he might have helped him. He concluded, however, that Sir William must expect him to appear in the billiard-room; so he rose and was following the other men. He passed close to Dolly to give her a private look of sympathy, when Dolly slipped a scrap of paper into his hand. As soon as he was out of the room he looked at it. 'Meet me,' it read, 'in half an hour in the Picture Gallery.'

The Picture Gallery! He had not the slightest idea where the Picture Gallery was!

In the billiard-room, he tried to lead Sir William into talk about his pictures, thinking that he might then offer to show his guests the Gallery. But Sir William did not respond, and Ferrers did not press the matter; for he thought him that if they did go to the Gallery, they might stay long enough to catch Dolly in the fact of keeping a clandestine appointment. The half-hour was fast running out. In desperation he whispered a falsehood to Sir William.

'Where is the Picture Gallery?' he asked. 'Mrs Drew has asked me to show it to her.'

'Not to-night, surely?' whispered Sir William in surprise.

'No; to-morrow.'

'Ah, well,' answered Sir William, 'I'll show you first thing in the morning. It's at the other end of the house—the part that has been built out.'

Ferrers lingered till there were but five minutes of the half-hour to run; then he said he thought he must go to bed, and left the billiard-room.

To have an appointment with the only woman in the world and not to be able to keep it! To have so much to say, so much to know, so much to confess, so much to ask, and withal to be dumb with doubt and apprehension—to long to see Dolly, and yet to be afraid to meet her alone!—and no chance of being resolved one way or another! He *must* find the Gallery! It was 'at the other end of the house;' but what that might exactly mean, and whether the Gallery was up-stairs or down he could not guess. He tried to be cool and collected. He understood that it was of no use for him to run off headlong down this passage or up those stairs. He could not ask any one openly to show him to 'the Picture Gallery;' but he thought that if a

servant should come along with a candle he would ask him or her to light him to the door. Perhaps, if he should chance on the way to it, he might encounter Dolly herself either going or coming.

So he adventured in the direction in which he thought he ought to go. He passed down a corridor which was dimly lighted by a small lamp at either end. As he advanced he saw the glimmer of a light appearing as if from above about half-way down the passage. He went on very carefully with his eye on it till he perceived that there was a recess, and in the recess a small winding staircase, which some one was slowly descending with a candle. He waited an instant, till he saw that the bearer of the candle was a woman, and that woman Aunt Dawlish! Where was she going? He waited a moment longer, till the glimmer of her candle was almost in his eyes; then, observing a door close by him, he swiftly and noiselessly turned the handle and slipped into the dark, closing the door again without latching it. He was about to strike a match to discover where he was, when a thin slice of light slipped past the door into the room. The door slowly opened, the light widened, and he had barely time to see he was in a dingily furnished room, whose walls were covered with books, and to whip himself behind a curtain, when Miss Dawlish entered with her candle. She closed the door, and leisurely she went and took a book from the shelves, and then sat down at the table; so that it seemed as if she meant to wait there for some time.

Ferrers was trapped. There was no keeping an appointment in the Picture Gallery that night, and there was no escape from that room so long as Miss Dawlish chose to remain! He found, however, that he was standing against a French window, which opened to the ground. He gently turned the key and the latch, opened the moving half, and stepped out into the summer night. He had barely slipped out when he heard Miss Dawlish come to the window, whether because she had heard the sound he made, or because she feared the fastenings were undone. He darted aside against the ivy, and Miss Dawlish not only latched and locked the window with great expedition, and with sharp complaints about the 'rank carelessness' of servants, but also shuttered it; and Ferrers realised that he was shut out!

CHAPTER VIII.—POINTS OF VIEW.

Ferrers stood among the roses and looked about and above him. The faint stars twinkled in the stilly night, the trees sighed sleepily, and vague, secret-seeming shadows lurked around. The cool air was laden with fragrance, and his soul was bedewed with the languorous richness of the odours of rose and honeysuckle, even as his head was moistened and refreshed by the summer dew. It was such a night as brings men face to face with the seriousness and seductiveness of Nature, as attunes their souls to large and noble thoughts, and at the same time tempts them to indulge in the sensuous fancies of love.

Ferrers was a man rather of action than of contemplation; his training as a soldier had

induced on him something of the spirit of the not too scrupulous adventurer, and his experience of barrack-life had somewhat coarsened the fibre of his affections. Yet, withal, the true, deep-seated Ferrers was a person of serious mind, honest heart, and romantic passion. Standing there in the vast stillness and melting beauty of the night, he became for the first time really aware of himself, and alarmed at the contrary impulses and desires that were pulling him this way and that. Without troubling to inquire how this strange effect was produced, he resolved to 'have it out with' himself.

He supposed he could get admitted to the house an hour thence as easily as at that precise moment; he did not particularly care whether he were let in at all; in any case, he would have a quiet walk. He was in evening dress, and he had no hat; but these facts did not trouble him: he was used to being exposed and to going bare-headed. So he put his hands in his pockets, and, with his eye fixed on the distance, sauntered away through the garden and across the park.

He set himself steadily to examine the conditions of his situation: how had he got into the coil in which he was involved? When—in an extremely needy hour—Sir William Dawlish had proposed to pay him a hundred pounds to merely call himself 'William Dawlish' and behave as such, he had promptly closed with the offer, thinking of it simply as a daring 'lark,' and seeing nothing of the painful issues and possibilities of his assumption. Now, in little more than a week, how was he situated? He found that he had not been able to behave as if he had been a block of wood or an automatic machine, or even an actor; he found that, in his own proper person as George Ferrers, he had been caught into the kindest and friendliest feeling for one of 'the jokers' whom he had engaged to get the better off in some way in his character as William Dawlish. He suspected that a match was planned between him, as William Dawlish, and the young lady whom George Ferrers found the most adorable woman in the world; and last and worst of all, he believed that young lady loved him as William Dawlish. Would it be impossible for her to love him as George Ferrers? Ah, if she only could! But the wish, the longing, was manifestly absurd. He could not, and he would not, hide from himself the fact—bitter as gall though it was to swallow!—that, though he was in all sufficient respects as strong, healthy, honourable, and complete a man as any in the land, he was shut out from all hope of marrying a lady of Dorothy Dawlish's position. He was but a poor soldier, with nothing to do—absolutely on the level of the unemployed workman—and if he ever married at all, he must marry a housemaid, a shop-girl, or, at best, a lady's-maid. He did not know why Sir William planned to work this deceit off upon his niece, or how he meant to consummate it—he hoped, indeed, no real harm was intended her—but he could no longer continue his share in it. It was unfair and cruel to Dolly—the dearest and loveliest of girls! It might be painful and humiliating for her to know the truth; but to continue the deceit was shameful and unendurable. He would go to Sir William, tell him he found it impossible to fulfil his engagement, and ask to be let off his bargain: he

would forego all promised advantage, and return penniless to London, a sadder but a wiser man.

By the time he had got as far with himself as that, he discovered that his hair was wet, his shirt-front sodden, and his feet drenched with dew: he believed he had frequently been walking on the turf, and he saw that he was coming out on the carriage-drive just by the lodge. The door of the lodge was open, and in the light which flowed from it Ferrers saw a man standing in his shirt-sleeves smoking a churchwarden pipe. When he came over against him, he perceived he was an oldish man, and guessed he was the lodge-keeper. The man hailed him and stepped out towards him.

'Ah, theer ye are, Mas'r Willium! Ah've been wonderin' if ye was to drop down an' see me. Ah on'y heerd a hour or two ago as how ye was at 'ome again. Heigh! But ye've been years an' years in foreign parts, an' it's a thick lump o' time since ah've seen ye! Ee, but hain't ye growed bigger an' broader? Sewer-ly! But ye're a fine man now!'

'Humph!' said Ferrers, not knowing well what to say and not troubling much. 'You know me, then?'

'Know ye! Ah should think so! Thik-theer dare-devil way o' yourn tells me! "Who but Mas'r Willium," says ah to myself, "can be gallivantin' out wi' ne'er a 'at on his 'ead?" No more gallivantin's now, though! He, he, he! And the old man laughed a creaking, mirthless laugh. 'Ah've heerd ye're goin' to be what we terms a family man.'

'Something of that sort, I suppose,' said Ferrers. 'But I must say "Good-night;" I find I'm very wet with the dew.'

'Heigh! But your voice is got stronger than it used to be too! Dear, dear! An' to think that ah might niver ha' seen ye thik-heer blessed night, if th' old woman hadn't got as crass as two sticks!—about nothin' at all, of course! So, ah comes to th' door for a smoke, an' ah sees ye!'

'Well, good-night,' said Ferrers.

'Good-night, Mas'r Willium.—Hullo! Who's thik-heer?'

A man—a tall man—had walked up to the gate from the road and had pulled the clanging bell. The lodge-keeper went to the gate, while Ferrers stood still to see if the tall man could be Lord Debrett. The gate, after a word of parley, was opened, and the man entered. It was Debrett.

'What? Is that you—er—Dawlish?' he asked as he approached. 'What are you doing down here like that?'

'Gallivantin', my lard,' laughed the old man. 'He, he, he! He was always a gallivanter!—Good-night, Mas'r Willium; good-night, my lard!'

'He seems to know you,' said Debrett, as they walked away together.

'Yes,' said Ferrers; 'better than I know myself.—But how is it you have just appeared?'

'I could not get away early; but I remembered my promise to you to be here to-day. So I telegraphed to your father'—

'My father?'

'Your—what do you call it?—putative father, Sir William.'

'Hang it, Debrett,' said Ferrers gloomily; 'don't joke about that.'

Debrett looked closely at him, and continued: 'I telegraphed that I would come by the last train and walk over with a handbag from the station. My man will come down with my things first train in the morning.'

'I see,' said Ferrers.

'It seems to me,' said Debrett, 'you must be still in a funk. How are things going? Anything happened? Surely nothing much in the way of action can have been done on the first night of meeting.'

'No; nothing much has happened, except that I have had to tell another lie or two.—Look here, Debrett; I'm going to clear out of the whole business.'

'Hallo!' said Debrett. 'What's that for? Spoil the sport just when it's going to come off!'

'I don't find it sport any longer,' said Ferrers.

'What? Has Dawlish been cutting up rough? He's capable of that, I daresay; but hadn't you better just have a straight talk with him?'

'I mean to have a talk with him,' said Ferrers, 'but not for that reason: I've nothing in particular to complain of in his behaviour.'

'What the dickens is the matter, then?'

'It's just this, Debrett: I'm beastly uncomfortable about the whole affair. The longer I go on with it, the more mess I'm getting into.'

'Oh! Bothered about Drumly again?'

'That's part of the mess; but the worst is something I found out to-night. We were talking at dinner, all very friendly. Sir William said something about home-farming, and that joker Drew took it that he was speaking about setting up house. I didn't see the thing quite at first. Everybody was smiling or looking comic about it; I even caught the servants tipping the wink to each other. "Hallo!" says I to myself, "there's something in this!" And then—you know how you see a thing all in a flash, and wonder that you were such an ass as not to see it before. "By Jingo!" thinks I, "they mean me and Miss Dawlish to set up house!"'

'You and Miss Dawlish?' said Debrett.

'You know what I mean: me, as Will Dawlish, to marry Dolly Dawlish.'

'Oh, is that the game?' exclaimed Debrett.—'Dolly, I suppose, has lots of money, then?'

'I don't know anything about that; but money or no money, it's an abominable shame to treat a girl in that way, and I'm not going to do it.'

'But,' said Debrett, 'it struck me when you first told me about Dolly that you were lost in admiration of her—in fact, that you were quite gone.'

'So I was,' said Ferrers bitterly; 'the more fool I. I didn't see or think where I might be going, till I heard this to-night. But, by Jingo! I know now, and I'm going to stop it!'

'I don't quite see,' murmured Debrett.

'Don't you see,' explained Ferrers, somewhat incoherently, 'that it's one thing to hang about with a kind, lovely girl like Dolly, talking to her and looking at her, and feeling that she likes to be with you? It comforts you and sets you up without your quite knowing why. But it's another thing altogether when you see all that brought slap down to the practical business of marriage—marriage with the person that you're not, but that you pretend to be! Then you've got to stand up and tell yourself the truth, and

say to yourself: "Come now, you've just been bluffing yourself all this time. You've been admiring the girl; and you've got fond of her—doosed fond, I may say—and there may be no great harm in that; but when you're properly fond of a girl, and you think she is of you, then—why—you want her for your own self. But here there can't be any marriage; first, because the girl likes you, not for your being yourself, but for your being to her somebody else; and second, because, even if she liked you for yourself, she couldn't marry you.—You know, for all your being a big long-legged brute, and the son of a fine honest old father that always paid his way, you're no better than a beggar!" 'Pon my soul, Debrett! isn't that the plain downright truth? And isn't the proper thing to do—the only fair thing to the girl—to stop the whole game, and let Sir William explain it as he likes? Let him call me a villain, an impostor, if he likes! By Jove! I think I deserve it!'

'But stop a minute,' said Debrett. 'Perhaps you're mistaken about the marriage.'

'I'm not mistaken, Debrett,' said Ferrers positively. 'I can't quite explain to you all the little things that make me certain about it; but certain I am that Sir William's game is a match between William and Dolly Dawlish.'

'It comes to this, then,' said Debrett with a laugh, 'that you, in a sort of way—don't you know?—are your own rival! Look here; why don't you go in and beat the other fellow?'

'What do you mean?'

'Go in and win Miss Dolly Dawlish for your very own self—for the man called George Ferrers.'

'What do you take me for, Debrett? Hang it! I may not be, as you told me yourself, the kind of thing you call a gentleman; but I'll try to pass for it, and I'll not be a cad; and I'd rather go into penal servitude than deceive that girl any more.'

'No need to deceive her, my boy. Tell her straight who you are, and ask her if she'll marry you.'

'I couldn't do it, Debrett.'

'But look here,'

'No; I couldn't do it. I couldn't lower myself to that: to ask her, a lady, used to the life she leads, educated, and very likely rich, to marry me!—*me*—who can hardly talk to her, and who hasn't a shilling, nor much chance of earning one honestly!—ask *her*, delicate and fine and sweet as a flower, to live with a rough beggar like me, and in the way I'll have to live! No, by Jingo! I'm not going to get myself laughed at and insulted by proposing such a thing!'

'But, my dear chap, there would be no need to live like that. She'd have plenty of money.'

'And do you think I'd live on her money?'

'But poor women marry rich men every day and live on their money.'

'That's all right,' said Ferrers: 'they're women, and it's what is expected of them.—You don't seem,' he continued after a pause, 'to have much good advice to give.'

'No, old chap,' said Debrett; 'I don't. But just listen to me one moment. I know more of this kind of life and this kind of people—ladies and all—than you do. And what I say at this

particular moment is this: before you throw up the whole game, set Sir William Dawlish against you, lose your money, and spoil your chance of getting anything to do after this, try to make sure that the young lady would thank you for throwing it up and being so lofty.'

'What? Do you think she'd rather I went on like this?'

'She might. All I say is, "Try to find out."'

'I don't believe it,' said Ferrers fiercely.

'At anyrate, think it over again. Sleep on it: you can't make a fuss till to-morrow.'

And that word of calm worldly advice allayed the impetuous heat of Ferrers' righteous resolution; and he said to himself that it might be better to sleep on it.

As it happened, he could have had no interview with Sir William that night, even had his determination been hot upon the point; for when they rang the bell at the hall-door, they were admitted by a sleepy footman, who—staring at Ferrers—informed them that they were "hall gone to their rooms." So Ferrers, with a last look out into the summer night, which was becoming all vague white mist below—out of which stood the tops of the trees, and dim, twinkling stars above—brushed the dew from his hair by rumpling it with his hand, and took off his coat and shook it before the wondering footman. Then he followed the domestic up-stairs with Debrett.

At the door of his room Debrett gripped his hand. 'Sleep on it,' he repeated.

'Will you be about early?' asked Ferrers.

'As early as you like.'

THE COMMERCIAL VALUE OF SMALL THINGS.

THERE are some things in common use of apparently such trivial value that their manufacture and commerce are scarcely ever considered, and yet some of these attain to very large proportions, and give employment to thousands of people. Pins, needles, nails, and screws have been frequently written about. Fifty years ago, the collective trade in these articles was stated to amount in value to two millions and a quarter. What they have reached to now it would be difficult to estimate. Steel pens, which then amounted in quantity to but seven hundred tons, valued at £175,000, are now the universal writing implements. The item of blacking, which in 1880 represented a sum of £560,000, must have doubled in amount with the progress of population and the use of the shoebrush. Christmas and New-year cards and valentines are trivial articles in themselves, and yet they form an enormous section of trade, giving employment to thousands. So with post-cards and penny stamps; 201½ million of the former circulate in a year; and over 1558 million letters are delivered annually, being at the rate of forty-one per head of the population. Thirteen tons of postage stamps are stated to have been sold in New York alone last year. So with the penny and halfpenny newspapers, which, being cheap and within the reach of all, have an enormous circulation. The penny articles sold in the

streets, and the annual savings of the people in the Penny Banks, are further instances of the aggregate value of small things.

Another article of small value but of large production is wooden spoons, made in Russia. We see nothing of them in this country, unless at some of the Russian stalls in an Exhibition, where those painted and decorated wooden spoons are bought as cheap curiosities. They are largely exported to Persia. About 126 million of these spoons are made every year, selling wholesale at from nine to twenty-four shillings the thousand. They give employment to large numbers, as in the subdivision of labour they pass through many hands; one workman cutting the wood into lengths, another shaping the spoon in the rough, a third hollowing it out, and a fourth painting and varnishing it.

It is said of some men that they are born with a silver spoon in their mouth; and of others, with a wooden one; but the Yankee had no spoon at all, for he was apparently born with a jack-knife in his mouth, so fond is he of whittling. He cannot see a newly-planed board but he must try the sharpness of his knife upon it. There is one production of wood which ought to silence all cavil at the importance of American 'notions,' and that is wooden shoe-pegs, of which a single State makes about fourteen thousand bushels annually, valued at four thousand pounds. A story is told of an American shoemaker who purchased of a pedlar half a bushel of shoe-pegs, all neatly sharpened at one end, and warranted to be of the best maple wood. He found them on close inspection, to be nothing but pine. Not caring to be taken in and done for after this fashion, and being constitutionally fond of whittling, he went at them with his jack-knife, and sharpening the other end of each peg, resold them to the pedlar on his next trip for oats.

During one of the visits of the Queen and Court to the Exhibition of 1851, after admiring and commenting upon the magnificent display of maize from the United States, Her Majesty noticed close by some baskets and boxes filled with what looked like grain, and inquired what seed it was. 'Seed, ma'am?' replied the exhibitor. 'Why, they be sole-binders,' at the same time lifting her foot to show their use. Prince Albert asked how they were made. 'Why, sir,' answered Jonathan, 'we just throw in junks of wood at one end of the machine, and the pegs come out at the other so fast as to keep the women-folks busy enough in gathering them up.—Ah, sir, America is quite a smart place for such notions.'

Forty years ago the quantity of wooden shoe-pegs dealt in here was twelve hundred tons, valued at about one pound a ton; and although they have been much superseded in the shoe-making trade, the quantity used is still very large. In the East, pegs of bamboo have always been used for fastening the chests and other wooden packages.

The little whitewood toothpick pointed at both ends was patented in America in 1866, and would seem a small article to create a monopoly in; yet the factory at Bucksfield, Maine, used up many thousand cords of wood every year in the manufacture of this small article. The cord of wood consists of a thousand billets or four loads. Two thousand five hundred toothpicks were sold for one shilling, and a large profit was made. Now, the patent having run out, many others have gone into the trade, and prices have fallen to fivepence the two thousand five hundred toothpicks retail, and even lower wholesale.

Toothpicks are made of the wood of the spindle tree ('*Euonymus Europæus*') in Germany. This manufacture is said to employ large numbers of the peasants in the Grand-duchy of Hesse during the winter evenings. There are four kinds made: No. 6 selling at two shillings per thousand; No. 7½ at three shillings; No. 10 at four shillings; and No. 15 at four shillings and sixpence. 'Parletos,' or toothpicks of willow-wood of nice finish, especially those called 'Flor du Parletos,' are sold in Portugal at prices ranging from fivepence to four shillings per thousand.

Owing to the substitution of steel pens for quill pens, other uses have had to be found for the goose-quill, and now they are converted into bristles for brushes, toothpicks, fishing floats, fuses for guns, and hair-pencil holders.

The last year in which the Board of Trade made any record of the import of quills was 1870, when 27½ million goose-quills, valued at £20,591, and 30,000 swan quills, of the value of £376, were received. The quills of the swan and turkey were used for engrossing pens, those of the goose for ordinary writing, and those of the crow and wild-duck for fine descriptions of writing. The classifications of goose-quills were numerous, according to their position in the wing pinion.

In one establishment in Paris 250,000 toothpicks per day are now made of quills, or considerably more than a hundred million yearly. Each woman engaged can fill twenty boxes in a day, containing forty small bundles of twenty toothpicks each, or eight hundred toothpicks per box. Some of the principal hotels and restaurants on the Continent and in the United States require their addresses printed on the toothpicks used by their guests; and in Spain and her colonies it is customary to have all kinds of gallant devices, or mottoes, impressed on them by a machine which makes letters and figures on the pen-quills.

In China an enormous trade is done in fire-crackers, not only for local use, but for shipment to India and America, in boxes of about forty packets. The average annual shipments are 162,000 hundredweight, valued at £304,000.

Bran, the exterior husk or refuse in grinding wheat, one would have thought to be a very unimportant article, and yet Holland ships about 32,000 tons, valued at £73,000. It is used to some extent for feeding stock, by tanners

and calico-printers, and for filling dolls and cushions.

The spawn of fish are a comparatively trivial article, and yet they lead to an important commerce. About 13,000 hundredweight of the roes of cod-fish are shipped annually from Norway, value £60,000. This is sent to France as *rogue*, to be thrown into the sea as attractive bait for the sardine fishery. The eggs of the sturgeon, under the name of 'caviare,' are shipped as a food delicacy from Russia to the extent of over 3000 tons, valued at £292,000. The roes of the mullet and other fish are also largely used as food in various parts of the Mediterranean. The whitebait, the sprat, the sardine, and the anchovy are the smallest of the finny tribe, and yet the collection and sale of these form important and very profitable industries.

A very tiny article is the egg of the silkworm, not bigger than an ordinary pin's head, and yet an enormous trade is carried on in rearing them. Each moth lays from two to three hundred eggs, and it takes about thirty-four thousand to weigh an ounce. Some years ago, when there was a disease in the European silkworm, it was deemed necessary to import fresh 'grain,' or 'seed,' as it is technically termed, from Japan. The importance of the trade may be estimated from the fact that there was introduced in the ten years ending with 1872 about four million ounces of silkworms' eggs to Italy and France, the aggregate cost of which was seventeen million pounds. The export trade in silkworms' eggs from Japan has, however, now gradually dropped of late years, from an average of one hundred and thirty thousand pounds to about one thousand pounds in value.

What individual, as he buys his penny bottle of writing-ink, thinks of the importance of the manufacture, and the extent of the trade, in this necessary ingredient of correspondence? Estimated at £25,000 in value forty years ago, what must it be now, with the advance of education, and the vast progress of commerce and correspondence—certainly £150,000. So with the production of printing-ink, a small manufacture in the middle of the century, but now an immense trade, in order to meet the ravenous demands of the printing-press for newspaper and book work. Some of the daily London papers use up three tons of printing-ink weekly.

It is not necessary to touch here upon the modern utilisation of waste substances. But there is one that was long looked upon as a nuisance and an encumbrance—sawdust. This is produced in large quantities at the numerous sawmills in America and Europe on the banks of rivers and lakes. The law forbids it to be thrown into the streams, as injurious to fish, and the steam-mills are unable to burn all their waste. Its chief use formerly was for packing blocks of ice, strewing cellars, &c.; but lately it has been found possible to compress it into the solid form of paper-pulp and roofing-boards.

Fifty years ago, matches as an article of manufacture and commerce were scarcely thought worth mention. The introduction and general use of lucifer matches and wax vestas has, however, created great industries of large commercial value. It is difficult to estimate accurately our home production; but figures have been given as to the trade and consumption in European and

American countries. Jönköping, in Sweden, is the oldest and largest match-factory in the world. It was established one hundred years ago; and in it are now to be seen specimens of the rude matches which were in use at the beginning of the century, when the flint and steel had to produce the spark to light the tinder in the box. The matches in those early days were big slips of wood furnished with a handle and a tip, to dip into a bath of sulphur. Jönköping used to supply the Continent, and still sends considerable supplies to England, although British makers now carry on an extensive trade. In 1863 the export of matches from Sweden was under half a million pounds in weight; in 1888, the quantity shipped was over thirty million pounds, valued at over five hundred thousand pounds. As a box of matches weighs less than half an ounce, 1000 million boxes were thus sent away from Sweden. But Norway also adds its quota in about one-seventh of the quantity made in Sweden, fetching, however, lower prices, being valued at about ninety thousand pounds.

The machinery for match-making has been brought to wonderful perfection. A machine cuts twenty-two match-sticks each revolution, and two hundred revolutions are made in a minute, so that it turns out over two million and a half daily, and the immense number of 821 million in the year. The process of the manufacture of the wooden match-boxes is almost as curious as the matches they contain. In former days matches used to sell in America at a half-penny each. The number of persons employed in making matches in the United States at some thirty factories is now many thousands, and the consumption is more than five matches daily per head of the population, or about 110,000 million. In France, the consumption is said to be about 200 million per day, the manufacture giving employment to ten thousand workpeople. The manufacture was farmed out; but the quality made is so bad, that the State intends to resume the manufacture, and anticipates making a profit of two hundred thousand pounds. The Argentine Republic imports wax vestas to the value of upwards of one hundred thousand pounds annually, the Spaniards being great smokers. Austria makes large quantities of matches, and they are sold at the rate of a farthing a hundred. A box contains fifty packets, each holding seventy lucifers. There are eight or more factories, some of which employ as many as five thousand hands. There are in Europe, it is believed, over fifty thousand factories, making matches to the value of ten million pounds.

Among other small things which have a commercial value are the seeds of the cones of various pines, largely eaten at present in Italy and the north of Europe and various parts of America, where they form indeed the chief food of different tribes of Indians. Another seed of trivial value, melon seeds, totally neglected in Europe, forms a considerable article of commerce in the various Chinese ports, and in some of them exceeding three to four thousand hundredweight yearly. They are eaten at dessert. The seeds of flowers of the various water-lilies also there form considerable articles of food. In some of the ports, the trade in lily flowers, as a relish for food, amounts to twenty thousand hundred-

weight annually, and of lotus nuts frequently twenty thousand hundredweight.

This cursory glance at small things shows the value to which many attain to meet the public demand.

DELAYED AT LAS PALMAS.

IN TWO CHAPTERS.—CHAP. I.

I WAS on my way home from South Africa, where I had been living for nearly three years, looking after the affairs of the mercantile firm of which I am a junior partner. Things had been getting into a muddle out there, and it was suspected that our manager was acting—not exactly on the square. It was desirable, therefore, that some responsible person should go out to investigate, and if needful, remain for some time, until that branch of our business was put on a more satisfactory basis. I had been admitted to the counting-house some years before by my uncle, who was one of the principal partners; and if I proved myself to be possessed of sufficient energy and business capacity, it was understood that I might eventually be taken in to the firm.

‘Robert,’ said my uncle, ‘if you are worth your salt, this should be a capital opening for you. It rests entirely with yourself whether you succeed or not.’

I had no special claims on my mother’s brother, who, though a bachelor, had many other relations; and since I could bring no capital into the business, I felt that the offer was a very generous one. I had the ball at my foot, so to speak, and resolved to exert myself to the utmost; and am proud to say that during the four years I was in the employment of the firm both partners were convinced that I was certainly worth my salt. As yet, however, there had been nothing further said as to my promised share in the business. Then came the proposal that I should go to Africa; and it was intimated to me that if I was successful in the management of that difficult and delicate piece of work, I should at once receive a junior partnership in the firm.

I was rather glad on another account to leave London at that particular time, for I had met with a bitter disappointment, of which I did not care to speak, and of which no one knew but myself. It was nearly a year before that I had met Louie Moir, whose sweet face and lovely dark-blue eyes haunted my dreams both by day and night. In short, I fell deeply in love with her. We met pretty frequently; played tennis together, danced together; and though I had not spoken of love, I had some reason to believe that she knew and understood my feelings; and I cherished the blissful hope that I was not indifferent to her. I had hitherto refrained from speaking, because, though my salary was pretty good, it was hardly sufficient to entitle me to ask Miss Moir to share it. Of course my prospects were good; but I thought it would be better to have an assured position before asking Mr Moir for the hand of his daughter.

One evening in June I went to a fête at the Botanic Gardens, where I expected to meet Louie. Presently I saw her with her mother

bending over a stand of orchids. A gentleman whom I did not know accompanied them, and was gazing through a pair of eye-glasses at the elegantly dressed crowds passing and repassing. I walked up and shook hands, prepared to saunter round with them as usual, to admire the exquisite groups of plants and flowers. I observed that Louie was pale and weary-looking, but this might have been due only to the heat. The other fellow—who was introduced to me as Mr Bremner—kept close beside her. As we could not well walk about four abreast, I was compelled to drop behind with Mrs Moir. She had hitherto treated me with cordiality and kindness; but to-day there was a marked change in her manner. She was cold and distant, and when she encountered a group of acquaintances, she joined them, and coolly bowed me off. I tried, but ineffectually, to get a few words with Louie, and hung about the gardens, perplexed and miserable, till I saw the Moirs leave, and then I departed immediately afterwards. I spent a sleepless night; but I resolved that next day I would call and explain my position to Mr or Mrs Moir, and ask their consent to speak to Louie.

As luck would have it, that very morning my uncle called me into his private room and told me they had just received advices from the Cape which made it imperative that somebody who could be trusted should go out without delay.

‘Now, I know that we can trust you, Robert,’ he said; ‘and if you have no objection, we should wish you to start next week.’

I expressed my perfect willingness to go at the time indicated; and some further conversation ensued, when I heard of something to my own advantage.

I was therefore in capital spirits when I started to make my call at Mrs Moir’s, for the promise I had just received from the heads of the firm was what I had been waiting for, and I could now approach Louie’s parents with more confidence. I found only Mrs Moir in the drawing-room. Miss Moir I was told was out. After a few commonplace remarks, I was considering how I could best introduce the subject nearest my heart, when the lady startled me by saying in her blandest voice: ‘I think, Mr Grahame, that you as a friend will be pleased to hear of anything which concerns the happiness of our dear Louisa. She is likely to be married before very long to Mr Bremner, the gentleman who was with us last night.’

My heart almost stood still with surprise and dismay. I could not speak for a minute; but Mrs Moir talked serenely on about her dear child’s prospects and Mr Bremner’s excellent qualities.

I managed at last to stammer out a few words of congratulation, but of course said nothing of my own blighted hopes. I mentioned that I was going to South Africa; and she made some inquiries about my purpose in going, the time when I proposed to start, and so on. She said she hoped I would call to see them again before leaving. I replied that I had a great deal to do, and might not have time; and she did not press me.

A week later I sailed without having seen Louie, for I could not bear to meet her under

such altered circumstances. I was glad to turn my back on England—glad that I had the opportunity of seeking oblivion among new scenes and strange faces.

In due time I reached my new field of labour, and found that the affairs of the firm were even in a worse condition than had been feared. I set to work, however, with zeal and energy, and by-and-by was able to bring things into better order. I was highly complimented by both partners, and received the promised reward. I might have returned to England in little more than a year, had I cared to do so; but there was no object in returning, and as my presence was desirable out there, I willingly agreed to remain some time longer. At length my health began to break down; and I was compelled to take passage by the *Coomassie*, and return home.

When out at sea, we encountered a violent storm; some of the machinery was damaged, and the ship was so much disabled that we were obliged to put in to the nearest port for repairs, which happened to be Las Palmas in the Grand Canary. We were likely to be detained there for several days, and some of the passengers grumbled a good deal at being delayed; but I was quite indifferent. The island was pretty, the temperature mild and genial after the great heat I had been accustomed to; and I thought a short sojourn there would be rather pleasant. I took up my quarters at Quiney's Hotel, where I found between thirty and forty guests were already located.

'This seems rather a jolly sort of a place,' said Dick Preston, a fellow-voyager with whom I had become rather intimate on board ship. 'I have just been having a look round, and there is an uncommon nice garden, with a lot of jolly comfortable-looking chairs, where one could lounge about and smoke for hours; and I saw a couple of rather nice-looking girls sitting in a place all covered with vines and creepers. I wish somebody would introduce me. I should like to make their acquaintance. I am told that splendid cigars can be had for very little. So I think, old man, that we shall be able to put in a few days here pretty decently.'

'Not a bad-looking collection,' said Preston in a low voice as we seated ourselves at the dinner-table some hours later. His remark referred to the company, who were dropping in in little groups of twos and threes and seating themselves at the table with nods and smiles to other groups, or friendly remarks to those near them.

'Yes,' I said; 'a very pleasant-looking party, and apparently very friendly with each other—quite *en famille*.'

As I spoke, I caught sight of a figure on the opposite side of the table, a little farther down—a slight girlish figure; and as I looked at her, a pair of lovely blue eyes met mine for an instant and then were bent on her plate. I observed her face flush and turn pale, and the hands which unfolded her *serviette* trembled. My own heart was beating painfully, and I answered Preston's remarks at random. Yes, it was she—it was Louie. I had no right to think of her by that name. She must be Mrs Bremner now; and oh, wretched fool that I was, that sudden meeting had revealed to me the fact that I loved her as

devotedly as ever! She was accompanied by an old lady whom I did not know; but I heard her say, 'Yes, aunt,' in reply to a question addressed to her by her companion. Two seats on the other side of her were still vacant. Would her husband be with her? I wondered. Presently, a young lady and gentleman came in and took the vacant seats, evidently only acquaintances. No—Mr Bremner was not there.

I hardly understood what was going on around me. A gentleman sitting next me was asking questions about the accident to the steamer, and I scarcely think my replies were very coherent, for I was straining my ears to listen to the tones of a sweet low voice which thrilled through every nerve of my being.

'I say, look here, Grahame. Are you well enough?' said my friend, turning to me. 'You look a bit shaky, don't you know?'

'Oh, I am all right,' I replied.

'You don't look it. But I suppose you have not quite recovered from your illness.'

'I did feel just a bit queer; but it is nothing. I shall be all right when I get outside. I shall just go and take a turn in the garden.'

But Dick's politeness would not suffer him to let me go alone. It was useless for me to protest, although I would have given anything for a few minutes' solitude to collect myself. We paced the moonlit garden, fragrant with the scent of roses and orange flowers; and then, as dinner was finished and other visitors came out to smoke, I suggested that we might take a turn down to the town. As we emerged from the hotel we were assailed by a collection of ragged urchins, who held out their hands clamouring for *cuartitos*.

'Get along, you troublesome little rascals,' cried Preston, accompanying his, to them, unintelligible remark by gestures which were sufficiently expressive. He succeeded in driving them all off except two, who persisted in constituting themselves our escort. Wherever we went they went; if we stopped, they squatted on the ground till we were ready to move on again, when they instantly jumped up and resumed their march. But the funniest thing was that the little ragamuffins had produced from the recesses of their tattered garments the materials for a cigarette, which they deftly rolled and smoked after the orthodox fashion.

The diversion created by the cigar-smoking vagrants had given me time to recover my composure, and I was now able to express some degree of interest in what was going on around me.

'Look here,' cried Dick, laughing. 'Here is love-making under difficulties. Look at this fellow, craning his neck up to a first-floor window, and the girl leaning out talking to him, or listening to his amorous speeches; and, by Jove! if there is not an old lady, the mother very likely, sitting inside and listening to every word. Poor beggar! It is hard lines for him. Great Scott! just imagine making soft speeches in the hearing of a prospective mother-in-law!'

It was impossible to help laughing.

'What a lot of nonsense I have talked to the girls in my day,' he went on reflectively; 'but if I had to spoon under these circumstances, I should very soon dry up.'

'Yes; I should think it would be an effectual barrier to flirtation. A man must surely be in downright earnest when he will stand making a public exhibition of himself like that,' I observed.

'Why, here is another at the same old game,' cried Preston as we turned a corner and almost ran into another fellow, whose neck was bent back to a most uncomfortable-looking angle, and who had no eyes for anything but the dark-eyed beauty who was bending down to him from the window. 'When I write a book on "The Canaries,"' said Dick, as he took the cigar from his lips, sending the smoke curling upwards, and regarding the red spark at the end meditatively—'when I write a book on these sunny and salubrious islands, I shall not recommend for universal imitation the manners and customs of the natives in the matter of courtship.'

Next morning about seven o'clock the attendant knocked at my door, bringing me a cup of tea, in accordance with the usual custom. He had scarcely left the room when Preston entered fully dressed. 'What! not up yet?' he cried; 'and sipping your tea like an old lady.'

'Have they not given you a cup?' I asked.

'No; thank you. A glass of "bitter" is more in my line, only it is so confoundedly dear in these happy climes. A few oranges are not a bad substitute, however.—But come; are you not going to get up?'

'What's the good?' I said lazily. 'What are you going to do?'

'Oh, just have a look round.'

'Well, you can tell me about it when you come back,' I said. 'I am not going to stir for a good hour yet; the days are quite long enough as it is.'

'Just as you like,' he said. 'I'll leave you to your repose;' and I heard his cheery whistle as he crossed the square, and I was left to my gloomy reflections.

During my residence abroad I had as a matter of course been in constant communication with my relatives and friends at home; but it so happened that nobody had ever mentioned Miss Moir's name in any of their letters. Indeed, there was no reason why they should, for the fact of my love for her was a secret I had kept to myself; and my attentions to her had not been so conspicuous as to excite general remark. From the hour when I had left her mother's presence, nearly three years ago, I had never heard one word about her, nor did I know if her marriage had taken place. I had scanned the columns of the *Times* diligently, but without meeting with what I sought, yet dreaded to find. It did not follow that she was not married, though I had seen no announcement of the event. Only, of course, it was uncertain; and I was at a loss how to address her, for I had made up my mind to speak to her, and only regretted that I had made no sign of recognition when I first caught sight of her. But the shock of surprise had deprived me for the time of my self-control. I lay and ruminated, unconscious of the flight of time, till I heard Dick's voice talking to some one outside. I sprang up, and hastily proceeded to dress, and in a few minutes my friend entered.

'It's a glorious morning,' he said, putting down his hat and mopping his forehead; 'only,

rather warm. I have been down to Elder & Dempster's office, and they tell me it is doubtful if the *Coomassie* will be ready to put to sea again for four or five days. Desperately annoying; but what can't be helped must be put up with.'

'Spoken like a philosopher,' I remarked; 'and after all it might have been worse. We might have been landed somewhere where there was nothing but birds' eggs and crabs to live on.'

'True enough.—But do you know I met with such a nice-looking girl, of the fair-haired, blue-eyed sort. Perhaps you may have noticed her last night. She was sitting at the other side of the table beside an elderly lady, who turns out to be a spinster aunt. I made the acquaintance of the old lady this morning. Her name is Miss Brown; and she has informed me that she came to the islands to take charge of her niece, who has been in rather delicate health. They have been staying at Tenerife for three weeks, and came here ten days ago. Her niece came out to meet her while we were talking, and she was good enough to introduce me. I intend to cultivate the niece. She is as pretty a girl as I have seen for many a day. Her name is Miss Moir.'

'What did you say her name was?' I asked, for my senses were all tingling at the sudden assurance that she was still Louie Moir.

'Moir—Miss Moir. The aunt's name is Brown.'

As we came down to breakfast we met the two ladies coming in from the garden.

'How do you do, Miss Moir?' I said. 'I hope you have not forgotten me?'

'How do you do, Mr Grahame?' she replied coldly.

Preston stared at me, but did not speak.

'You have been some days on the island, my friend here tells me,' I remarked.

'We came about ten days ago,' she answered in the same cold constrained voice.—'May I introduce you to my aunt?' and she performed the brief ceremony, and immediately turned to Preston and chatted to him freely, leaving me to converse with Miss Brown, with whom I exchanged a few remarks as we entered the breakfast room.

'Grahame, you sinner,' said Preston as he took his place beside me at the table, 'you never told me that you knew Miss Moir.'

'I was not sure it was her you meant.'

'You must try a better lie than that if you want it to pass for truth,' said he dryly.

'Well,' I replied, 'I understood she was married; but I was not sure.'

'Hum,' he said, looking at me sharply; 'you saw her last night. I wonder if her presence had anything to do with your loss of appetite? I believe you were spoons on her at one time, and that she threw you over.'

'Don't! there's a good fellow,' I said; 'I will tell you about it afterwards.'

'All right,' he answered with a slight nod, glancing across at Miss Moir, who was talking to the gentleman on the farther side of her, and never looking in our direction.

When the meal was over, she rose and left the room, going straight up-stairs. I hung about in the hope of seeing her again, for I was anxious to find out if possible how it really stood with her, and if she was cognisant of the information her

mother had imparted to me. It could hardly be that Mrs Moir had intentionally deceived me, yet, if Louie knew that I had been told that she was about to be married, she could not be surprised that I did not see her again. But if she did not know, I reflected with bitterness and despair that my abrupt departure, without one word of farewell, must have wounded her feelings and her pride terribly, if it was as I had once fondly hoped, and that she was not engaged to Mr Bremner. If I could only get a chance to speak to her, all might be explained; but she seemed determined to avoid me.

She came down-stairs at last, and was passing me without a look or a sign of recognition. I stepped forward and would have spoken; but she only gave me a haughty bow as she passed out. At the luncheon table it was just the same—she persistently ignored me.

I wandered listlessly about the town, accompanied by Preston, who proved himself to be of a real good sort. He neither chaffed me nor worried me with questions, though he saw plainly enough that something was wrong. He rattled on with the kindly intention of cheering me up, for I was about as lively as a mute at a funeral. We strolled into the Museum, and inspected the mummified remains of the dead and gone Guanches, the ancient inhabitants of the island; and some old red pottery and other articles, which may have been the work of the hands which have for ages been folded under these queer mummy cerements. But we soon had enough of the ancient relics. Leaving the square where the Museum is situated, we walked along one of the narrow streets which have such a gloomy deserted appearance, with the windows all covered with green shutters. These shutters, which are called *postigos*, have a habit of flying suddenly open when those within wish to get a view of what is passing in the street. We were rather startled by a *postigo* flying open just in front of us, and a dark-eyed damsel appeared at the window, the object of whose curiosity was evidently our humble selves. Preston courteously raised his hat to her and said, 'Bonita muchacha,' which was all the Spanish he knew. The 'pretty girl' thus addressed withdrew her head with a coquettish toss and a smile, half closing the *postigo*; but we had not gone far when she peeped out again, when Preston smiled and waved his hand to her. He was quite proud of his knowledge of the language, and again murmured 'Bonita muchacha' as we passed a girl with a white lama shawl arranged over her dark locks in the form of a mantilla. The young lady smiled, showing all her pearly teeth.

The natives are very tolerant of the eccentric vagaries of foreigners; nevertheless, I thought it just as well to warn my friend that the Spaniards are a jealous race, and that it might be wiser to deny himself the pleasure of making his usual remark as we passed a lady in a black lace mantilla whom we saw approaching. However, he had another chance, for, as we neared the lower part of the town, many hands were stretched out to us, begging for *cuartos*. My friend selected one of the nicest-looking girls he could see, and bestowed a few coins upon her with his usual remark. She was delighted, and made some voluble expressions of thanks, which

were of course meaningless to us, and then ran off, returning in about a minute with another girl, whose hand she held up, pointing to herself and then to the other girl, whom she called 'Carina.' We understood her to mean that since she had found favour in our sight, she desired us to extend our generosity to her friend also, which we could hardly refuse to do. Our liberality, however, procured for us the undesirable distinction of a numerous escort all the way back to the hotel, all holding out their hands at intervals and keeping up an irregular chorus of 'Cuarto, cuartito.'

'Hang me if I won't learn some more Spanish this very night,' said Preston; 'but it shall be the equivalent for some strong phrases that shall send these rascals scattering.'

THE MIXED COURT OF SHANGHAI.

A STRANGE or, rather, unique institution is the Mixed Court of Shanghai. This Court is constituted to administer justice in the settlement of all the cases in which foreigners and Chinese are involved, when the foreigner is the plaintiff and the Chinese defendant; and in the cases in which both parties are Chinese residing in the settlement. In the case in which the defendant is a foreigner protected by or belonging to a country having treaty with China, the case must be tried at his Consular Court, where the suit is brought by the plaintiff.

As for the natives, the Mixed Court trials are generally limited to slight offences, or contraventions of municipal regulations. For the crimes of a certain gravity, the Mixed Court gives generally a verdict of non-competency. Then the defendant is sent to the city magistrates, by whom the culprit is judged and sentenced to be tortured, or massacred, if necessary.

The Mixed Court is presided over by a Chinese magistrate, a mandarin of inferior order, representing the Tao-Tai or governor of the city or district, who only attends the Court when a case of great importance is called for. When the Tao-Tai is present, a Consul-general also attends. On other days, a foreign assessor sits with the magistrate. The assessors are always chosen among the members of the consular body having a fair knowledge of the Chinese language. They have only consulting powers, and their special duty is to look after the interest of the foreign plaintiff, and to ensure the bylaws of the settlement being enforced. According to the existing rules for the municipal administration, there are in Shanghai two Mixed Courts, one exclusively French, sitting in the French Concession; and another cosmopolitan, sitting in the so-called English Settlement.

The external appearance of the Mixed Court is not very imposing. A number of monsters are exhibited, to inspire the desired terror to wrong-doers, and especially thieves, who, notwithstanding the sight of those awful faces,

continue to steal, just as if theft was a Chinese national institution. Close to the gateway are two huge cages formed of strong bamboo, inside which are seen the prisoners condemned to the 'cangue.' The bars are almost wide enough for a thin fellow to wriggle through; but such an attempt would be unhappily prevented by a wooden collar about two feet square and more or less thick according to the gravity of the transgression, and which the convicts must wear from morning to night. This instrument, which is by the Chinese called 'kia,' and by the foreigners 'cangue,' has the wooden frame firmly secured by an iron bar all round, and is closed with a lock, from which hangs a long chain, which binds their waists or attaches together two or more men condemned to the same punishment, joining in one inseparable squad several Celestial scoundrels.

On the planks of the cangue there are written in large Chinese characters the name of the culprit, the crime committed, and the length of the sentence. Sometimes on the sides of the cangue there are two holes through which the men must put their hands, and then they are fed by others. For small offences, a man wearing the cangue has his hands free, and he can easily eat, drink, or smoke; and with the great familiarity usual in China between prisoners and outside friends, the former never fail to get fruits or tobacco from passers-by. In the latter case, it seems to us that once having become accustomed to the collar, the life of a man sentenced to this kind of punishment is not much to be pitied. The convicts condemned to wear the cangue walk a couple of hours through the streets, and each of them has to stand in a humble position before the door of the house where the crime was committed.

Passing through the portal, we enter the courtyard. Other demoniacal figures adorn the walls and show their awful teeth. In front, above the door through which enters the mandarin, there is one which specially attracts the visitor's attention: it is a kind of dragon with a *gaietta pelle*, like one of Dante's three beasts. The hideous monster is said to be the emblem of avarice. It is painted there, it is said, to show that avarice of 'squeezing' is a sin which the mandarins are to guard against; but, unhappily, this precious maxim is in China, more than in most countries, well appreciated, but badly applied.

Even the courtyard is of some use in the administration of justice in China. Here takes place the flogging, a practice which the Celestials have been used to for several thousands of years, and which Western civilisation, coming to play the rôle of Queen in the Far East, thought convenient to maintain for the sake of the European prestige; but also because many Europeans believe that without the intervention of the bamboo, it is impossible to obtain respect from the Chinese. The flogging is administered in public. The culprit is brought in by a Court runner, who holds him by the pigtail. He is delivered from the cangue, if he wears one; and after having his hands and feet bound, he kneels down before the mandarin who attends the flagellation. The blows, which vary from ten to five hundred in one or more times, according to the sentence, are applied to the most fleshy

part of his bare thighs. Sometimes the punishment is borne with indifference; and when the culprit has paid his tribute to justice, he runs away with the nimbleness of a cat; while another, screaming and yelling like one possessed by evil spirits, cannot walk or even rise. You must not believe, however, that this difference of self-command in the face of the bamboo originates from a stronger physical constitution or greater moral force. The cause is only due to the amount of cash the condemned man is able to pay. Before lying down, a good word said to the flogger will mollify his cruelty and determine the weight and severity of his blows. It seems that a regular scale exists; blows of whole strength, three-quarters, half-strength, and no strength at all. Justice thus admits of modifications. What guarantee the officer can have against being cheated by a scoundrel who afterwards would not pay the appointed sum, we cannot tell; but we should think there are very few who refuse the due reward to the old Cerberus, because not only would all credit be stopped on the next occasion, but he would make him pay the arrears, and also the interest of the old affair, by supplying him with blows of extra strength; and this, you will agree with us, is well merited and conducted justice.

After the courtyard we come into the courtroom. The hall of justice, like all the rest, has a miserable appearance. A table badly joined is the Bar. On the Bench, a huge inkstand, pencils, and tablets of Chinese ink, a teapot and teacups, as tea is served during the sitting. Besides these commonplace objects, there is a peculiar one, which claims attention. It is a hollow cylinder, full of tallies or slips of wood, a number of which are taken out and thrown on the floor by the magistrate when the sentence is to be pronounced. These sticks are picked up by the attendants and counted. The slips are of different value, like gambling counters. Some are worth one hundred, some fifty, ten, or five blows each; but the condemned man has the consolation of expecting a deduction of ten per cent. at the delivery of the same. This liberality goes to the Emperor's credit, and it is called the Imperial favour; according to the Confucian maxim, that in enacting laws, severity is a necessity; while in executing them, mercy is to be granted.

Behind the Bench are placed two or three chairs—one for the mandarin, one for the assessor, and a third for another consul, who happened to be interested in the case.

The magistrate wears the mandarin dress of the order to which he belongs; on his head he has the 'mao,' or round mandarin hat, with a yellow, white, blue, or red button, with some peacock feathers, according to his rank. In winter he wears a long fur-lined robe with square embroideries in the mandarin style; in summer, a long robe of thin embroidered silk, buttoned up to his neck, from which hangs a long chain of glass beads. As for the foreign assessor, there is neither wig nor Court robe; some even wear a morning dress and keep their hat on, just to contrast with the Chinese magistrate who, against the rules, sometimes takes his off.

Not seldom a disagreement between the magistrate and the foreign assessor occurs. In the

spring of 1885, for instance, an amusing episode took place between the magistrate Huang (which means yellow) and Mr Giles, British Vice-consul, both of an equally excitable temper, and suffering apparently from liver disease. In a moment of irritability, Mr Giles, who has the reputation of being an eminent Chinese scholar, seemed to have said something that wounded the susceptibilities of Huang, who struck slightly with his pencil (not on purpose, certainly) Mr Giles's hand. He pushed the mandarin's hand, causing the pencil to fall from the fingers of the Chinese. The latter, greatly excited, hit the shoulders of Mr Giles, who rose and left the Court, to the extreme regret of the public and the prisoners, who were taking great delight in this unexpected *entr'acte*. The incident did not end here. The British Consul-general asked of the Tao-Tai the dismissal of magistrate Huang; and having failed in obtaining it, he appealed to the consular body, which, by collective action, should demand satisfaction for one of the members thus roughly treated by the magistrate. But the application to the consular body proved unsuccessful, as the majority were not persuaded of the advisability of keeping on the assessor's chair one whose excitability would produce no better results than to maintain a state of irritation with the local native officials. The matter was therefore sent to higher authorities at Peking for a decision; and the response was a judgment worthy of King Solomon: Huang and Giles to be both recalled. In the place of Mr Giles was appointed Mr Playfair, who we are sure did always justice to his name, and made 'fair-play.'

The prisoners brought before the Court belong, of course, mostly to the lowest class of people. Among the number of natives, the wheelbarrow and 'rik-sha' coolies, the 'san-pan' and cargo boatmen, figure rather prominently in the Court transactions. The majority of cases are petty larcenies, thefts of articles taken from an opium or tea shop or from a lodging-house. Besides, there are to be noticed the peculiar crimes of the Chinese, such as kidnapping, disputes over the sale of a wife, the mortgaging of a concubine, &c. It is not unusual also for a foreign master to prosecute his house-boy or his 'mafoo' or groom for having stolen money, jewellery, or house-implements.

Another class of rogues are the street gamblers; but these fellows are too smart to be easily caught. They practise their trade in a den of some deserted by-street. A comrade keeps a lookout, to report the coming of a policeman, who is never or hardly ever in a great hurry. At his approaching all scatter away, and no sign of gambling is perceived. As soon as the majesty of the law is out of sight, the comrade returns to his watch, and gambling is heartily resumed.

Very curious is the trial of the Chinese Court. The prisoner is brought in by a Court runner, who holds him by the cue on arriving before the magistrate; the prisoner kneels down, and must remain erect on his marrow-bones all the time the case lasts. If he tries to squat down or to find a more comfortable position, the guardian, not previously prepared by a good word, pulls his cue mercilessly and forces him to keep erect. The process of interrogation is also very curious, and by no means respectful. A runner appointed

by the magistrate, and acting in the capacity of interpreter, should a plaintiff or a defendant speak in a dialect not understood by His Worship, tries to interrogate one of the prisoners, while half-a-dozen people interested in the case shout at the same time. Then, when silence is obtained, the defendant tells his story. As a rule, the Chinese never admits himself guilty. He cries, shouts, howls, wails, weeps, gnashes his teeth, strikes his forehead strongly on the pavement, in order to protest his innocence, till the guardian, if not absent-minded, brings him to reason by jerking and pulling his pigtail at the very moment his lamentations may lead some one to consider the tail is useful for something. Many times the plaintiff, who may be as much excited, goes down on his knees and, without asking permission, begins also to gesticulate and scream with a deafening voice, in order to persuade the magistrate of the justice of his complaint.

No counsel, barrister, or lawyer of any kind is allowed to plead in the Court, and their absence makes the whole thing quicker. The magistrate, after having heard the opinion of the foreign assessor, pronounces the sentence, which in all cases will cause the greatest misery to the condemned man. A fine of two hundred 'cash,' with the alternative of one or two days' imprisonment, overwhelms the culprit with grief. He begins again to yell and strike his head, until the runner, pulling him up, drags him out of the Court, where, as soon as the man sees that there is no way of getting off cheaper, he reconciles himself to his fate, and even rejoices over his good luck.

A frequently successful trick for a prisoner to prove his innocence is the appearance of an old man, calling himself the prisoner's father or grandfather, who declares that his son is a model of filial piety, the touchstone of morality in China. Sometimes the grandfather is a genuine one, but more frequently is borrowed for the occasion.

A very good impression would be made on the magistrate if a Celestial charged with assault could bring in a grandfather hurt in some way, with his face bleeding, or having bruises on his arms or legs or a huge plaster on his chest, in such a condition that he could give evidence that the grandson was forced to strike other people in order to defend him and save him from certain death.

THE COTTAGE BY THE BURNSIDE.

THE Cottage by the Burnside has no longer any existence except in the memories of those who were interested in it and its old inmates. A quiet moorland road, which winds along the hillside for miles between upland pastures and occasional patches of corn, turnips, or bog-hay—'a gey bare streak o' a road,' as the country-people call it—dips down at one point into a little glen, clad with oak, birch, and thorn trees, with here and there a slender waving rowan-tree and an undergrowth of sloe and hazel bushes. A bright little burn, which rises far up in the moorland, and descends in a succession of linnis and sunny pools, winds through this wooded glen to the river

Nith. An old stone bridge carries the lonely road aforesaid across the glen and the burn; and from this bridge, in former days, might be seen the cottage by the burnside, which formed a picturesque object in the landscape, standing as it did on an angle formed by a sharp bend in the stream. The cottage had been an old barn or granary in former days, and had a high thatched roof, and odd little windows of various shapes and sizes.

Behind the cottage were hidden the byres and piggeries belonging to the 'dairy' of cows which occupied the place of the old farm buildings to which the cottage in its original capacity of a granary had belonged. The waving trees of the glen formed a background green and soft in summer, and a black network of branches against gray winter skies; while all the year round, looking over the parapet of the bridge, the burn filled the foreground, sometimes drumly and turbid with sudden 'spates' among the hills, but generally rushing briskly among the boulders in its channel. It was a stream beloved by fishers, for wonderful takes of trout were by no means rare; and sea-trout, or even a salmon, were sometimes got in its pools.

A rough cart-track led from the end of the bridge, and wound under the trees down to the cottage, which was on the side of the square next to the burn. A very rough road it was at all times, and in wet weather it was almost impassable. Old David at the dairy used to say, with a cheery twinkle in his eye, 'It's an uncommon road for mud this.' An old door, warped and frayed with age, led into a flagged passage; and from it, again, another door of the same ancient description opened into a large low room with smoke-blackened rafters and a stone floor, worn into hollows with age and the tread of many feet. Two old 'presses' of dark wood; a 'kist' for blankets; a dresser, gay with many-coloured plates, bowls, and jugs; an eight-day clock about a hundred years old, with a brass rim for a face—'that chappit unco slow,' as Eppie used to say. Such was the furniture of the cottage, completed by two box-beds, hung with blue checked linen curtains; and a big spinning-wheel, which stood winter and summer by the peat-fire, and filled the cottage with its murmurous hum, as Eppie, the younger of the two old sisters, stepped briskly back and forward before it, deftly twisting the 'rowans' of wool which lay in a big basket beside her into a strong worsted thread.

At the first glance, it seemed as if Eppie were the sole inhabitant of the homely dwelling; but on looking into the farther box-bed, a very old woman might be seen, with her shoulders propped up by pillows, and a form so small and shrunken that it hardly showed beneath the heavy bed-clothes and crimson counterpane. The bed linen was coarse but snow-white; and here, for thirty-five long years, Betty Brydone had lain. She was a small fair woman, very different from Eppie, who was big-boned and broad-shouldered,

with a homely kind face, and a shrewd glimmer of humour in her gray eyes. Any one looking at the two sisters, and judging from appearances, would at once have said that Eppie was the moving spirit of the small household; but it was not so. Betty, or 'Bet,' as she was always called, with her frail form, pink and white cheeks, and eyes blue and calm as a child's, had an indomitable will; and, moreover, she had 'the purse,' for she fortunately had a small annuity, which, with the proceeds of Eppie's spinning and her own industry in plain sewing, was quite enough to supply their modest wants.

An old neighbour who used often to visit them said: 'Bet was aye *maister*; but Eppie was a rare dounce canny woman, and so they did fine. Bet aye keepit the siller in a stocking fit, aneath her pillow; and when we gaed to our tea at the New-year time, or thereawa', she verily brocht out the siller teaspoons frae the bed, and gied them to Eppie for our tea.'

When a visitor went in, after a hearty welcome, and the ceremonial—never omitted on Bet's part—of changing her apparently spotless cap for another which was supposed to be fresher, and which hung on a nail at the 'bed-heid,' she would chat briskly about the weather, the village news, &c., while her thin white fingers never ceased to sew rapidly at the caps with many frills which she was quite famous for making.

Very, very seldom did Bet touch upon her own story; but at rare intervals she did. Two ordinary lifetimes had been hers—forty-five years of busy bustling life, filled latterly with the ceaseless cares and endless activities of a small farmer's diligent wife; then thirty-five years of absolute helplessness and comparative penury; but through it all, in storm and sunshine her brave spirit had never flagged.

Bet and Eppie were shepherd's daughters, who had early gone out into the world to win their bread and work their own way. Bet, after a few years, married her master, the miller on Airdle Water. A small farm was attached to the mill; and here, for more than twenty years, they led a happy prosperous life, with only one drawback—they had no children to gladden their home. At last, trouble came; some of their money was lost by the dishonesty of a relation; the miller himself died; times were very bad; some of the 'beasts' died; but Bet only worked harder than ever.

One bright August morning they were carting in hay from a sloping field near the Airdle; the larks were singing high in the air; grouse were calling on the moors; the rabbits with their white tails popped in and out among the bushes by the burnside. The workers were in high spirits, for this was the last of the hay, and it would soon be safely in. Bet was on the top of the cart, spreading and packing the hay as the men tossed it up. Always active, she was working with might and main that day that they might get through. Suddenly, something startled the horse; it jumped forward; in an instant the cart was overturned, with Bet beneath it; and in that moment all life's activities were over for Bet for evermore. They carried her home to the mill, apparently lifeless; and when consciousness returned, it was found that her spine had been

hopelessly injured, and that her limbs were perfectly powerless.

Her husband's heirs agreed to take over the mill and the stock, and to pay Bet a small annuity of ten pounds a year. Eppie, who was also a widow, and whose family were grown up and doing for themselves, came to live with her; and after some little trouble and shifting about, they finally settled in the cottage by the burn-side, where they passed the remainder of their lives in peace and quietness.

The outside world rolled on with its chances and changes; railways and telegraphs became accomplished facts; the scream of the steam-engine was heard even in their quiet valley; but Bet never saw a railway train! The Crimean War, the Indian Mutiny, the Franco-Prussian War, all went and came; but to them there was little change but that of the seasons—summer and winter, seedtime and harvest. In the summer, Eppie went out to 'cast' their peats or to give some neighbour and his family a hand at the hay; but the only change the summer brought to Bet was, that she had longer light for her seam. For a good many years they had only one window, and it was at the side of the fireplace farthest away from Bet's bed; but after a time they got another window in rather a curious way.

The one disturbing element in the prevailing quiet of Bet's bed-ridden life was a rumour that the factor had said at various times that the cost of keeping up the old granary was far more than the rent the old women paid for it, and that therefore he was going to pull it down, and they must seek for quarters in the village. This was a sore heartbreak to Bet, for, as Eppie said, she 'couldna thole a change.' One fine day the factor came to see the state of matters for himself; and the sight of Bet's combined helplessness and independence, and Eppie's affection for the sister who was at once so strong and so weak, overcame his resolution to warn them out. He gave orders not only to repair the granary, but to make a small window of four panes directly opposite Bet's bed, which, as she often remarked afterwards, in tones of the deepest gratitude, was 'an extraordinary' benefit to her. From this window, lying on her pillows, she could look across the burn and see the young lambs in the holm on the other side, and the trees bursting into leaf near the road.

No one ever heard a murmur escape from Bet's lips; it was the Lord's will, and that was all she ever said. She sometimes wished she could have gone to church; but both the parish minister, and the minister of the dissenting church, to which she and miller Brydone belonged, were, as she often said, 'rale attentive to her.'

'Do you never weary, Bet?' a young girl said to her one day, impressed by the monotony of a life limited by the box-bed and the homely fireside.

'Whatfor suld I weary, my dear?' was the old woman's quick reply. 'I hae my wark, and I keep up a guid heart. We were never sent into this war!' to weary, but to work.'

That was the secret of Bet's humble philosophy and cheerfulness; and who shall say she lived in vain; for, though the two old sisters and their cottage have passed away, yet the remembrance

of them and others like them animates the Scottish men and women of to-day to emulate their patient contentment and brave endurance—to work their work, and to keep up 'a guid heart' through it all.

A DEAD FRIENDSHIP.

THERE is no more to say;

Some bitterness of thought is left unsaid,

And broods within the heart and will not go,

But leave it thus untold to fade away,

And give no life to what is better dead:

Each knows the other knows it; leave it so.

Henceforward we may meet

With knowledge of each other, but not love;

Here for the last time we shake hands and part;

Our love has waned, our faith grown incomplete;

Which is at fault we may not hope to prove,

For each acquits himself to his own heart.

Ah! friendship has its spring,

Like all things else, its growth and its decay;

It may not last, its summer is not long;

When it is dead and ended, shall we bring

But bitter words unto its grave, and say:

Thus didst thou wrong me! Thus thou didst me wrong!

Nay, hush! Let us forget.

What profit is it to remember all?

Let us remember only what was best.

Things that were bitter, things that pain and fret,

Ill thoughts we may regret but not recall,

Let them be all forgotten unexpressed.

And I will think that you

Died with your hand in mine, one summer when

Our friendship still was at the full, and we

In all our thoughts were each to other true,

That thus, my old-time friend, and even then

You died.—I ask you to think thus of me.

So each, perhaps, may keep

Remembrance as of one he used to know,

A dear dead friend he ne'er again shall meet,

And ne'er forget; forgetfulness shall heap

Its dust on all but that, and we may grow

To find in such remembrance something sweet.

THE LAND OF INCONGRUITIES.

SOMEWHERE, India has been called the 'Land of Incongruities;' and no term could better describe the curious state of things therein produced by the running side by side of Oriental stagnation and Western progress. We have a great country inhabited by millions, the vast bulk of whom are immovably rooted in their intense conservatism; who are trammelled by a network of caste laws and prejudices; and who cling with the obstinacy of ignorance or fanaticism to their old customs and traditions. Then, scattered thinly over this desert of bigoted superstition, we have little colonies of educated Englishmen, who may be considered to be on the whole of rather superior culture and intellect, as nearly all owe their present position to having passed a competitive examination of more or less severity. These latter, with their wives and daughters, have exhausted the resources of Europe to surround their Indian homes with every luxury that can help to make their exile more tolerable. They live everywhere in that free and pleasant social intercourse that is one of the greatest charms of Indian life; but their nineteenth-century civilisation for ever rubs shoulders with the prehistoric barbarism of the great nations round them, in which these little British stations are immersed like islets in the sea. There is no sharp line drawn between them; everywhere we find the two extremes touching and overlapping. The punkah that waves overhead in the most luxurious drawing-room furnished with every refinement of modern art, is pulled by an almost naked savage squatting in the veranda outside, a creature who neither knows who we are nor whence we come, but regards us as beings from another sphere, whom he might possibly worship, if he were capable of worshipping anything higher than his copper coins and his caste rules about eating.

Alongside of the big English shops we find the hovels of the 'bunniah,' who grind the grain they sell between two stones, and swindle their

helpless customers over a thimbleful of lentils. The bunniah may be a thousand times richer than the European shopkeeper behind the plate-glass windows next door; he may have a perfect silver-mine of rupees buried under the mud floor of his hut; but still he sits in filthy rags in a hole where he can barely turn round, cheating the wretched coolies over a farthing's worth of rice, as his ancestors did a thousand years ago. He has enough learning to cook his own accounts, or to calculate the interest on five rupees at a thousand per cent., and he sends his son to school until he can just do the same. Then the son takes his place beside his father in the shop, and squats there for the rest of his life, never stirring save for the purpose of collecting his money, or to arrange about selling up some unfortunate debtor; until, fifty years or so hence, he will be carried feet foremost to the burning-ghat, leaving the silver-mine under the floor somewhat larger than he found it, as the result of his long life of sordid meanness.

Many curious inconsistencies naturally spring from the presence of the three great and very distinct races now living together in India. First, there are the original inhabitants, the Hindus, with their great system of caste, and a religion that nowadays apparently consists entirely of caste rules and laws, referring principally to the matters of eating and drinking. Next come their Mohammedan conquerors, of a more haughty and warlike nature, and imbued with the spirit of a vicious and intolerant religion that permits no compromise between the forcible conversion and the extermination of the unbeliever. Finally, there are the English, masters of both, and the present rulers of the land.

The accident of a similarity in colour between the Hindu and the Mussulman, and the fact that the two races are so closely mingled and living side by side all over India, makes it very difficult for any one not dwelling in the country to realise the gulf that lies between them, or the bitter enmity that is kept latent only by a power stronger than either. The Hindus, usually the

most peaceful of men, and ready to live amicably with those who do not endanger the purity of their caste, burn under the recollection of the insults and oppression of their Moslem invaders, and with the dread of another similar fate should India unfortunately be at any time left to her own resources. The Mohammedans look with the most utter contempt on everybody who is not of their religion, and feel equal hatred and jealousy for Hindu and Englishman alike. They reject the opportunities—that the more pliant Hindus have been quick to take advantage of—afforded by our offering the means of education and subsequent employment to the natives of India; and prefer to dream sulkily of the days of their bygone glory, or of the bloody revenge they would execute, could the sword of Islam once more sweep across the land.

Wherever we English live in India, there the three races are found together. Our servants are drawn equally from both the native classes. Cooks and table-servants are invariably Mohammedans; while grooms, bearers, gardeners, and outdoor servants generally, are usually Hindus. Through this circumstance, perhaps, order in the household is better maintained, as each class, so ready to take advantage of and swindle the master themselves, keep a sharp eye on the sins of the other party. Mussulman and Hindu live side by side in the bazaars amicably enough to all appearances, except when some festival, with its processions and drums and noise, goads the opposite faction to madness like an Orange band among the Fenians. Heads are then broken, and blood is freely if harmlessly spilt, till the police, and sometimes even the military, hunt both sides impartially about the streets until they disappear.

As the races are intermingled, so are their religions. In the throng of the street the Mohammedan spreads his praying-cloth and prostrates himself towards Mecca almost in the shadow of the Hindu temple; and the sweet sound of English church bells mingles with the voice of the muezzin and the braying Hindu conch. At your own church gates may be seen the dirty little wayside Hindu shrines of mud, garnished with bits of red rag and garlands of marigolds, and black with the smoke of votive lamps; while, if you happen to live near any sacred city, you will be edified by the spectacle of hundreds of hideous fakirs, rivalling each other in the loathsomeness of their attire, and the ingenious unpleasantness of their self-imposed penances, walking, crawling, or rolling along the road, or prowling about your servants' quarters in search of alms.

In all his farming operations the native clings with the greatest obstinacy to the ways and customs of his forefathers. Travelling by rail over the hundreds of miles of fertile plain in the north of India during the spring harvest, past the wretched little clusters of mud hovels where

the agricultural population live, one may see everywhere among the fields the mud-plastered thrashing-floors on which the wheat is being trampled out of the ear by bullocks. On the great heaps of grain and chaff and broken straw lie the men watching the noisy children who keep the cattle on the move, and the women laboriously reaping the ears of wheat one by one with a small knife. Then, if there be any breeze, one sees the women standing on the top of a bullock cart or other elevation, with baskets poised gracefully over their heads, pouring down a stream of grain from which the chaff is blowing like a cloud of smoke. When the grain thus primitively thrashed and winnowed is transferred from the creaking, crawling bullock-wagons to the railway train, it bids farewell to the leisure of the Old World; the demon of steam takes possession of it; and hurrying from train to ship, from the sunny plains of India to the murky docks of England, it passes into the whirling machinery of the mills at home.

Under the walls of the great woollen mills at Cawnpore, whose huge many-windowed blocks are nowadays more suggestive of Manchester than of mutinies and massacres, there may be seen natives weaving cloth just as they did before Cæsar conquered us skin-clad savages in Britain. Two sticks driven into the ground have the warp strung between them, while the wool is laboriously woven across the threads from a shuttle held in the hand. The yarn they use has been spun on the rudest imaginable spinning-wheel, or made by the help of distaff and spindle, the latter weighted with a stone ring similar to those found in Celtic barrows at home.

I remember a curious scene at Cawnpore some years ago. I was living on the banks of the Ganges, not a quarter of a mile from the notorious massacre ghat where Nana Sahib's treachery overwhelmed the unfortunate captives he had deluded with the hope of release. From the edge of my compound on the river about a mile of the stream was visible, and on this stretch of water there were seldom less than a couple of deceased Hindus to be seen floating with the current, or stranded on a sandbank with half-a-dozen vultures tugging at them. Bones and skulls were scattered along the banks, and even carried into the garden by the vultures, where they had to be periodically collected by the gardener and returned to the sacred river. The next house was a regimental mess, so close that we had the full benefit of its band on guest-nights. One moonlit evening the band was playing when a violent thunder-storm came on. At one moment the river would be lit up by the sudden glare of lightning, at the next the cosy lights from the messhouse would shine out into the darkness. The band, as if by arrangement, played some weird overture, which mingled with and now and then was lost amid the thunder and the howling wind. In the short lulls, the moan of jackals and the cries of startled birds came over the water to join in the concert. The scene was incongruous enough. There was the mess-room, brilliant with lights, the table glittering with silver and flowers, and twenty Englishmen dining luxuriously on the very edge of the black storm-lashed waters of the sacred river that was bearing past its dead within a few yards of them.

Then the storm passed; the moon shone out from among the breaking clouds, and the refrain of a dreamy waltz changed the picture from one of fury into peace in a few moments. But the ominous black specks still broke the silvery surface of the water; and the name of England may be but a faded memory ere the old Ganges ceases to take its dead children to its bosom, as it used to do, perhaps, when the ice-cap of the glacial epoch lay thick on the British Isles.

A SOLDIER AND A GENTLEMAN.*

CHAPTER IX.—SIR WILLIAM'S FRANKNESS.

FERRERS was astir betimes. He drew up his blind, flung open his window, and took a great draught of the clear morning air. The sun shone gloriously, dissipating the vapours of the night and the sleepy fragrance of the flowers; a lark carolled overhead in the fresh gaiety of rejoicing; and Ferrers felt that it would be a delightful world if he only had a clear and easy conscience. When he had dressed, he went to find Debrett. He thought he might not yet be up, so he knocked at his door, and receiving no answer, he turned the handle and entered. Debrett was still asleep in bed. Ferrers shook him by the shoulder, and at once he was awake and alert, as became a soldier. 'Hallo!' said he, 'what's the matter?'

'You promised,' said Ferrers, 'to be up early.'

'What's the time?'

'A little after six.'

'What's the use,' grumbled Debrett, 'of getting up when there's nothing to do? There's nothing to shoot.'

'There's rabbits, I daresay,' said Ferrers.

'Rabbits!'

'Well, we can have a walk and a talk, and a look at the crops.'

'Look at the crops—and shoot rabbits!' exclaimed Debrett. 'There speaks the farmer! I wish you wouldn't, Ferrers.—Is the door closed?'

'Yes,' answered Ferrers. 'And I *am* a farmer—or at least a farmer's son, and not a lordly sportsman.'

'Oh, you feel like that again, old chap. All right. I'll get up and have a look at the crops with you.'

Ferrers went down into the garden and hung about until Debrett appeared, when they strode away beyond the bounds of the park—stretching their long legs in unison—and entered upon devious paths by coppice and corn-field.

'May Mr William Dawlish smoke a pipe in the country?' asked Ferrers.

'Certainly,' answered Debrett. 'Why not?'

'That's just what I thought: "Why not?"' said Ferrers. 'Still, I thought I'd like to know from an authority if it was the correct thing.'

'So you've made up your mind to go on with the game?'

'No; I have not, Debrett. I'm going to put the matter to Sir William as soon as possible.'

'Well,' said Debrett, 'remember what I said to you last night: before you throw it all up, be sure that the young lady will approve.'

'Yes,' said Ferrers. 'And I must have a word with her about another thing. I forgot to tell you last night that when she saw we could get no talk together in the drawing-room, she asked me on a slip of paper to meet her in the Picture Gallery.'

'She did—did she? Well?'

'I didn't meet her.'

'Why? How was that?'

'I couldn't find the Picture Gallery. I was in search of it, when I had to retreat before Aunt Dawlish into a dark room, where she—without knowing it—pursued me, and drove me out bare-headed into the garden.'

'Oh, that was it!' laughed Debrett. 'But how are you going to explain all that to Miss Dolly?'

'I don't know. I don't see how I can explain it without telling her the truth. And then I'm in this double fix: I ought to tell Sir William first that I must tell her, and that will make an explanation necessary to him of the necessity of telling her.'

'And so you would have to betray the lady's confidence? That won't do.'

'No; I see that won't do at all. But what will do?'

'Let things be as they are; and tell Miss Dolly that you could not keep the assignation because you had to flee before Aunt Dawlish. Then she'll laugh at a big soldier like you running away from Aunt Dawlish, and it'll be all right.'

'Yes; that might do. And then, I know, she'd look so charming, I'd want to take her in my arms.—No; I must first have my talk with Sir William: I can't go on like this.'

'What an obstinate fellow you are!' exclaimed Debrett.

'Debrett,' said Ferrers, and he stopped and laid his hand on his friend's shoulder, 'you don't understand me in this. I feel about it more, far more, than you think. I'm hit—hit very hard here. I could die for that girl!—and I'm deceiving her! My boy, you can only tell what the grinding feeling of that is like when you're really, right-down, in love. If I go on as I have been going, seeing her, sitting with her, and talking to her, I shall have to do something mean: I shall have to run away with her! That would be madness, you see, and I want to get out of it.'

Debrett looked on him, and saw that he must be grievously smitten; his hopes, his fears, and his desires were so extreme and contradictory.

'All right, my boy,' said Debrett quietly. 'I understand, and I sympathise; and I'll stand by you as your friend. Shall I break the matter to Sir William?'

'No; thank you, Debrett,' said Ferrers; 'I think I'd better go through with it myself.'

'The sooner the better, then. Shall we go

[* Copyright reserved in the United States of America.]

back? You may have a better chance of getting him alone before breakfast than after.'

So they returned towards the house. And the sun rose higher and hotter in the heavens, and the larks rose with a less joyous song to a less height, and returned to earth more quickly. They had got nearer Dawlish Place by only a field or two, when, on the margin of a coppice a little way off, they descried three men.

'There is Dawlish, I believe,' said Debrett; 'but who are the others? They can't be the bankers: Drew and Drumly don't stand so high as that, do they?'

'No,' answered Ferrers; 'they're not Drew and Drumly. Besides, Drumly's lame.'

That he said on seeing the two strangers part from Sir William and walk hurriedly off. They were both tall, but the one seemed powerfully built, and the other slimly and delicately. They moved away arm-in-arm; but it appeared to Ferrers that the stronger was hastening the steps of the weaker. They skirted the coppice and then disappeared round its end.

'I wonder who they are?' said Debrett. 'They don't look like farmers; they didn't behave like servants.—But here's Dawlish.'

The baronet appeared to have just discovered them. He lightly waved his hand, and sauntered to meet them.

'Been looking at your covers, Dawlish?' asked Debrett. 'How are the birds?'

'Oh, they seem in good condition.—But how is it you are out so early? I'd have thought that, coming in so late as you did, you'd have wanted to lie in bed in the morning.'

'I did want to lie in bed; but this man would have me out. He has got a bad liver or something.'

'He doesn't look like a man,' said Sir William, with one of his polite grins, 'that knows he has a liver.'

'Perhaps it's a bad conscience, then,' said Debrett. 'I know he has got something the matter with him.'

'Oh!' said Sir William, with a quick look of suspicion.

'And I want a word with you about it,' said Ferrers.

'With me?' exclaimed Sir William. 'But I'm neither a doctor nor a parson.'

'But it concerns you,' said Ferrers.

'Oh!—Well, say on.'

'Shall I leave you?' asked Debrett.

'If Sir William Dawlish doesn't mind,' said Ferrers, 'I'd prefer you to stay: you've known of this business since the beginning.'

'Stay by all means,' said Sir William, looking more keenly suspicious; while Ferrers paled somewhat, and was sensible of such an agitation beneath his waistcoat as he had experienced when he had first faced 'the jokers' Drew and Drumly.

'The fact is,' began Ferrers, 'I'm getting more and more uncomfortable in this business, and I want to put it to you whether you can't let me off my bargain.'

'That's awkward,' said Sir William. Then, with a sharp look: 'You seemed comfortable enough last night: what's the reason of the change?'

'I've been turning over things in my mind, and I find I can't go on.'

'But why? I think you owe me a reason—I do, Ferrers. Having gone so far, I think you should frankly explain to me why you can't go on to the end. What are you afraid of?'

'Well, then, frankly—I am as much afraid of myself as of anybody or anything.'

'What do you mean?' asked Sir William.

'Somehow or another, I've got to care more for Miss Dolly Dawlish than I ought to do.'

'You shouldn't have done that,' said Sir William with a snap.

'How could I help it? You slip into things of that sort before you know.'

'Oh! He, he!' laughed Sir William; and there was a quality of cynical derision in his laugh which irritated the other.

'It is very absurd in me, I know. But a man can't help his feelings, though he can help how he behaves. That's why I confess it to you, and ask you to let me go.'

'Have you told the young lady that you are in love with her?'

'Most certainly not. That would have been behaving improperly to her and to you. You don't seem to understand what I said.'

'Oh, quite. Well, so long as you say nothing about it, there's no harm done.'

'But, good heavens, Sir William! have I no feeling? If I go on seeing the young lady and talking to her, I may lose control of myself!'

'But you mustn't,' said Sir William with a grin.

'If you have controlled yourself so long, you can surely control yourself for a day or two longer; that's all I ask of you. I put it to you on the point of honour. I went into this business in full dependence on your good sense and cleverness; I have performed my part; is it fair in you to abandon yours? You see we stand or fall together in this. If you give up your part, the whole thing is burst up; and it will be more than a fiasco: it will be a disgrace both to you and to me.'

Ferrers pulled his moustache in silence.

'If you go away now,' said Sir William, 'how am I to explain your disappearance?'

'You will excuse my saying,' resumed Ferrers, 'that there is something else troubles me besides my own feelings. I may be wrong, but I have a suspicion that you are using me for a purpose I don't like being used for.'

'What do you mean?—Speak out.'

'Well, I don't like,' declared Ferrers, 'to be in the position of a sort of promised husband to Miss Dawlish.'

'Oh, that's what you don't like,' laughed Sir William. 'But what makes you think you are in that position?'

'Will you answer me truly, Sir William?' said Ferrers, in a tone which might be taken for demand or entreaty according to the temper of the listener. 'Is there a marriage arranged, or going to be arranged, between William Dawlish and Miss Dolly Dawlish?'

'Now you're asking questions,' said Sir William. 'You are contravening the compact I made with you as a good soldier to carry out instructions without demanding explanations.—I think, Debrett, that is something like the form of words I used?'

'It is, Dawlish,' answered Debrett.

Ferrers said nothing; but he tugged at his

moustache, and his look became more grim and obstinate. Sir William noted the look, and diplomatically set himself to mollify and disperse it.

'I'll not be hard on you, however,' he said. 'I'll admit that your guess is correct—in part, only in part. But—there is no possible William Dawlish but yourself. It is a sad—a humiliating—thing for a father to confess, and I must say I had hoped to avoid the confession that my son is to all intents and purposes non-existent; to the world and all its duties and affairs he is practically dead.'

That seemed so obviously sincere and heartfelt a confession, and tallied so well with what Ferrers had overheard at the outset of the business, that he accepted it without hesitation, and indeed felt rather sorry he had extorted it.

'There is,' continued Sir William, 'in the expectation of the trustees, you understand, the prospect of a match between Miss Dolly Dawlish and Mr William Dawlish.—Now you know. What then?'

'Then, Sir William,' answered Ferrers, 'I can't carry out my share of the plot: I can't go on deceiving the young lady.'

'Deceiving?' exclaimed Sir William. 'What would you say if the young lady were herself a party to the plot?'

'By Jove!' exclaimed Debreth.

'I don't believe it!' said Ferrers flatly: the mere suggestion contradicted his belief in the young lady's frankness.

'You are somewhat unreasonable,' said Sir William with a shrug; 'but a little temper is excusable in you at present. Now I'll be kind to you, and, just as one man to another, I'll explain the whole matter. I'm hard up, and have been for long; a mortgage will foreclose soon, and if it do, I'm ruined.—You perceive I am quite frank with you. All that my niece knows: I have told it her; and she is only too glad out of her prospective abundance to help her uncle.'

'She is a trump!' exclaimed Debreth.

'She is a Dawlish,' said Sir William sentimentally. 'My brother left her his heir, with a certain reversion to me, you understand; but I cannot in my need touch the reversion, nor even raise money on it, and my niece can only touch her own money on the eve of her marriage. You understand that?'

'Perfectly,' said Debreth.

'But even then she cannot touch it unless her trustees, Drew and Drummy, approve of the match. Now they know that my brother wished that my son, if possible, should marry his daughter. Therefore, we have devised this marriage—this marriage which cannot come off, because when the time comes William Dawlish will be gone.'

Ferrers said nothing; but his thought was troubled by two points that gleamed upon him from Sir William's revelation: Dolly, then, knew he was not William Dawlish, and she was consciously playing, for her uncle's sake, a game with him. These points were so disheartening to him, simple and modest as he was, that he at once called himself a fool for his presumptuous beliefs and doubts, and resolved to have done with the business, escape, and forget all about it.

'Now I have frankly told you the state of things,' said Sir William, 'what do you say? It must at the longest be all over in a day or two, and you may judge for yourself whether or not Miss Dawlish is conscious of the state of things.'

'I'll go on then, and see it out,' said Ferrers quietly. He was not quite sure he was doing right in assenting; for he was bewildered as well as disheartened by the new and plausible view of things presented by Sir William, and, moreover, he heard in his ear the suggestion which Lord Debreth had made but a few minutes before: 'Try to make sure that the young lady would thank you for throwing it up.'

'Very well,' said Sir William, as if it did not much matter whether he did or not.

'That's all right,' said Debreth about five minutes after the matter had been thought concluded. 'I thought it would be.'

They were approaching the house—they had indeed crossed the park and were entering on the garden proper—when they saw the very two men from whom Sir William had parted by the coppice, hurriedly cross the end of the garden and disappear somewhere in the neighbourhood of the stables. Ferrers, having his attention so much occupied with other things, would have made but light note of it, had he not remarked the look of resentment, almost of fury, with which Sir William regarded them. That look fixed the incident in his memory. There was another thing smote him disagreeably ere they reached the hall door: an open vehicle drove up bearing luggage and two men, one of whom was probably Debreth's servant, while the other was certainly the servant of Mr Drummy—the black-muzzled Irish-American.

But all common disagreeable things were forgotten in the deep unaccountable misery he felt, when, on chancing to raise his eyes just when under the wall of the house and against the richest rose-bushes, he espied Dolly Dawlish looking down on him from an open casement. When she knew herself seen, she withdrew, and hid behind a flaunting curtain; but Ferrers still felt that her eyes were on him.

ANCIENT STEEL.

It was the deliberate opinion of the wisest of men that 'there is nothing new under the sun.' And indeed, in the study of the manifold developments of applied science in the present day, one is surprised to find how many of its elementary principles were known and acted upon in ancient times, and how that knowledge and appropriation have continuously supplied the foundation on which the superstructure of our vast and increasing attainment is built.

To a great extent this is the case with steel; and in taking as the subject of this paper, 'Ancient Steel,' we purpose to draw attention to that branch of its manufacture which dates from pre-historic times, and which, after its entrance into the sphere of authentic record, possesses an historical continuity down to the period at which we date the birth of modern steel, rather more than a quarter of a century ago, and which, so

far from being disused or non-existent at the present time, forms the groundwork of the main applications of the processes now in use.

Dr Percy is perhaps alone in his theory that in the precession of the prehistoric ages, the Iron Age preceded the Age of Bronze. Nor does the solution of this problem of precedence receive much assistance from that far-reaching book of the past, the relics of ancient Assyria and Chaldea—whose definitely fixed chronology goes farther back than that of any other nation of primitive antiquity; as the results of early metallurgical work are therein presented to us concurrently, both in allusions to various metals in the mythologies and literature of the first epochs of their national life, and also in the numerous articles of bronze and iron unearthed in the mounds, and found enclosed in sarcophagi. The existence alone of certain little iron instruments bearing cuneiform characters carries us back to perhaps more than 4000 B.C., as the earlier language, of which the cuneiform character was the written symbol, had had time to become almost obsolete by about 3000 B.C.

Of the conditions of metallurgical industry in ancient Egypt we infer more than we learn from written records. The gigantic architectural works, of all but prehistoric antiquity, which were the great glory of ancient Egypt, involved a considerable knowledge of more than the elementary principles of applied science, and the existence of tools of extreme efficiency. Now, recorded history in Egypt undoubtedly begins with Soris (Seneferu), the king whom Manetho places at the head of the fourth dynasty, and whose monuments and inscriptions are the first of the series in which is written the history of ancient Egypt, and which carries us back to at least 2700 B.C. To his three immediate successors tradition ascribes the building of the great Pyramids; and in regard to these it is simply impossible that tools composed of any metal but extremely hardened iron (that is, steel) could have been effectually used in dealing with the granite and hard stone of which they are composed. Equally so is this the case with the obelisks of a later date, the earliest of which we learn was the work of the second king of the twelfth dynasty. The monarch whose works are made most widely known throughout the modern world by his inscribed monoliths—which have found a resting-place in capitals of Europe and America—was Thothmes III., also of the twelfth dynasty, the specimen of his work which we possess being the obelisk on the Thames Embankment. To the same period belongs the representation discovered by Wilkinson on the walls of one of the Theban tombs, depicting a forge and bellows, and various stages of the smelting process, together with an object which is probably a crucible. Pictures of knives, shears, &c., occur in representations of various deities and mythological facts, which of course belong to the earliest conceivable period of

the nation's history. Experts in the deciphering of the hieroglyphic inscriptions conclude from them that the Egyptians were familiar with the working of iron.

Metallurgical work in iron and steel among the Hindus is of such remote antiquity that its origin and early development cannot satisfactorily be traced; but the method of manufacture was practically identical with that which constitutes the main metallurgical industry of India at the present day, and which thus presents an almost unique phenomenon of uninterrupted continuity throughout many centuries—the Wootz-steel. This ancient Indian Wootz-steel, which is practically the result of fusing a mixture of malleable iron and carbon, is in its main outlines a crude and miniature anticipation of the modern Siemens process; as, similarly, points of identity are perceived between an ancient Japanese method and the great Bessemer process.

The Chinese, who, in very early ages, had attained to some degree of understanding in the elementary principles of science, and their applications, possessed also a comparatively advanced amount of knowledge in the manufacture and use of steel. Of its origin among them we have no account; but it is quite conceivable that its discovery preceded that of the lodestone, which under the name of Tche-chy (directing-stone) was in use among them fully 2600 B.C. There is mention of steel in very ancient Chinese writings, and an account of the process of manufacture by one writer about 400 B.C.; and various descriptive allusions to it, implying a considerable amount of knowledge and power of discrimination in reference to its properties, occur at various subsequent periods down to the present day, when it is still a flourishing branch of their manufacture.

Inferentially, it is perfectly clear that the Phœnicians were acquainted with the use of extremely hardened iron (properly speaking, steel), as their numerous and beautiful works in ornamental metallurgy, and the cutting and engraving of precious stones, for which they were conspicuously eminent among the nations of antiquity, necessarily involve; as also do the inscriptions which exist in the Phœnician language. Phœnicia, as represented by its famous daughter-city of Tyre, was at the height of artistic celebrity in the time of David and Solomon (1050–1000 B.C.). With them, as powerful neighbouring monarchs, Hiram, the ambitious young king of Tyre, found it wise to enter into a friendly alliance, and concluded an arrangement which proved to be for the mutual advantage of both communities, in the numerous works of art and value, especially in metallurgy, executed by his trained artificers for the furnishing and enrichment of the Temple, Capital, and Palace at Jerusalem.

In the time of Homer, iron was well known, but was much less used than bronze, being costly, as we infer from the fact that he makes Achilles

offer it as a prize at the funeral of Patroclus. Three times in the *Iliad*, Homer speaks of iron as *polukmētos*, that is, a metal obtained with great labour. In the preface to Dr Schliemann's *Mycenæ*, Mr Gladstone says: 'The poet [Homer] always mentions it [iron] as a rare and valuable substance, *used where great hardness was required*, and for objects comparatively small and portable.' It is clear also that in Homer's time the art of tempering was well known; with regard to which Professor Roberts-Austen says: 'The knowledge that steel might be hardened must have come to us from remote antiquity. Copper hardened with tin was its only predecessor, and it continued to be used very long after it was known that steel might be hardened. . . . The Greek alchemical manuscripts, which have been so carefully examined by M. Bertholet, give various receipts, from which it is evident that in the early days the nature of the quenching fluid was considered to be all-important. There were certain rivers the waters of which were supposed to be specially efficacious.'

Hesiod, writing a century after Homer, speaks of iron as having been unknown during the age of bronze. Inferentially, it was well known and used in his own time.

A very interesting discovery, made by Dr Schliemann during his researches at Troy, was that of a dagger of steel four inches long, one and six-tenths of an inch wide, with a double-edged and arrow-shaped blade, in a perfect state of preservation. He says of it: 'This is the first object of iron found by me here—nay, until now I had found no trace of iron in any one of the four prehistoric cities, the ruins and débris of which succeed each other here; neither had I found a trace of that metal at Mycenæ.'

Herodotus (484 B.C.) speaks of a colony of Phœnician workers in metal whom Cadmus, an ancient king of Phœnicia, had brought into Greece; but Day's investigations lead him to conclude that it was not introduced into Greece from the Phœnicians, but from Egypt. Aristotle (384 B.C.) says that iron is purified from scoria by melting, and having become sufficiently pure by being thus treated several times, it is changed to steel (*stomōma*). Hence we are led to suppose, says Sir William Siemens, that in Aristotle's time, steel was made by careful selection and treatment of steely iron, which latter was produced by something analogous to the ancient Catalan process of producing iron or steely iron direct from the ore in finery hearths. Aristotle also alludes to the Wootz-steel of India, which in his time and country was well known, and evidently excited interest, as he gives details of the process of its manufacture.

The historian Diodorus Siculus, of the time of Julius and Augustus Cæsar, mentions an ancient method of manufacturing steel swords, in which the iron was buried in the ground and left till rusted, with the result that the blades were so finely tempered as even to cut through a nail without spoiling the edge—in which rather striking assertion, Plutarch, writing in the early years of the Christian era, concurs.

By the time of the first Pliny, an extensive knowledge of steel, its properties and manufacture, evidently prevailed. In his *Historia Naturalis* there are many references to it and its uses. 'By

means of iron and steel we build houses, hew quarries, and cut in stone; yea, and in one word, we use it to all other necessary uses of this life.' 'No kind of iron shall match in goodness the steel that cometh from the Seres [that is, Serica, a geographical designation corresponding in Ptolemy's time to North-west China]. . . . In a second degree of goodness may be placed the Parthian iron; and setting aside these two countries, I know not where there may be any bars or goods tempered of fine steel, indeed; for all the rest have a mixture of iron more or less; and generally in the most parts of the world wherein we live, all our steel is of a more soft and gentle temperature than that of the Levant. The goodness of steel in some countries ariseth from the nature of the mines, as in Austrich; in others from the handling and temperature thereof, as by quenching. . . . The finer any edge-tools be, the manner is to quench them in oil for to harden the edge, for fear lest the water should harden them overmuch, and make the edge more ready to break out into nicks than to bend and turn again.' With a good deal more on the subject. In Pliny, too, occurs the first mention of 'cold-shortness,' from which we assume that the presence of phosphorus in those early days was a source of perplexity to manufacturers. The etymology of the words 'cold-short' and 'red-short' is more intricate and obscure than would at first sight be supposed, and if it could be accurately ascertained, would perhaps throw some light on the experiences of pioneers in the metallurgy of steel. Holland translates Pliny's word for 'cold-short' as 'colsar,' the earliest form of the word with which, as far as we are aware, we are yet acquainted.

Galen (131 A.D.) alludes to knives made from Indian steel (Wootz) as being remarkable for their strength and hardness.

In South Africa the Kaffirs have from time immemorial manufactured a kind of steel for their assegais by heating the raw iron ore in contact with charcoal and otherwise treating it. Amongst other tribes, Mungo Park found a simple process in use, his description of which is familiar to all who have read his Travels.

Written records of steel and its uses are but scanty during several early centuries of the Christian era, the only information we have concerning the condition and progress of the metallurgical industry of iron and steel being contained in allusions to various weapons of war among the Britons at the time of the Roman invasion, and the rather extensive employment among the Romans of iron and steel in military accoutrements, hunting-weapons, and implements of domestic use, of which antiquarian research has discovered and preserved many relics.

Towards the later part of the fourteenth century we find records of the importation of steel from Germany, and of the settlement of a colony of German steel-workers in Northumberland, where they carried on a considerable trade and achieved some celebrity. From the fact of its importation we conclude that little or no progress was being made in British steel manufacture during this period.

Mentions of various uses of steel and statutes in reference to it, its importation and home manufacture, increase in frequency throughout

subsequent periods, though we have no account of the industry itself, or any improvement or development, until, in the year 1540, the theory of steel manufacture once again finds a place in the world of letters. Vanoccio Biringuccio, in his *Pyrotechnology*, one of the earliest works on metallurgy extant, published in that year, describes a process which consisted of the retaining of malleable iron for some hours in a bath of fused cast-iron, when it became converted into steel; a theory which in 1556 found corroboration in the *De Re Metallica* of Agricola, who describes the process by an engraving which depicts bars of iron standing upright in a charcoal fire similar to that of a Catalan hearth. After an exposure of several hours to the highly-heated charcoal and carbonic oxide, they became converted into steel.

In 1722 Réaumur produced steel by melting three parts of cast-iron with one part of wrought-iron (probably in a crucible) in a common forge; he, however, failed to produce steel in this manner on a working scale. This process has many points in common with the Indian Wootz-steel manufacture.

To Benjamin Huntsman, a Doncaster artisan, belongs the credit of first producing cast-steel upon a working scale, as he was the first to accomplish the entire fusion of converted bar-iron (that is, blister-steel) of the required degree of hardness, in crucibles or clay pots, placed among the coke of an air-furnace. This process is still carried on at Sheffield and elsewhere, and is what is generally known as the crucible or pot-steel process. It was mainly supplementary to the cementation process, as formerly blister-steel was alone melted in the crucibles; but latterly, and at the present time, the crucible mode of manufacture embraces the fusion of other varieties and combinations of metal, producing accordingly different classes and qualities of steel.

In 1839, Josiah Marshall Heath patented the important application of carburet of manganese to steel in the crucible, which application imparted to the resulting product the properties of varying temper and increased forgeability. He subsequently found out that a separate operation was not necessary to form the carburet—which is produced by heating peroxide of manganese and carbon to a high temperature—but that the same result could be attained by simply in the first instance adding the carbon and oxide of manganese direct to the metal in the crucible. He unsuspectingly communicated this after-discovery to his agent—by name Unwin—who took advantage of the fact that it was not incorporated in the wording of the patent, and was thus unprotected, to make use of it for his own advantage. The result was one of the most remarkable patent trials on record, extending over twelve years, and terminating in 1855 against the patentee—a memorable instance of the triumph of legal technicalities over the moral sense of right.

It will be seen that the direct result of the processes of ancient and existing use to which we have referred is exclusively 'hard steel,' that is, highly carburised steel, represented chemically by its principal constituent of the metalloïd carbon—varying from about six-tenths to one and a

half per cent.—and readily capable of hardening and tempering; with regard to which—hardening and tempering—many amusingly curious theories and practices were in currency among alchemists from time to time throughout the period succeeding the middle ages.

DELAYED AT LAS PALMAS.

CHAPTER II.

In the evening, after dinner, Preston and I were sitting on the flat roof of the hotel. This was a favourite lounging-place, for there was more air than down in the sheltered garden. There were plenty of basket chairs scattered about, and it was very pleasant to look over the flat roofs and the feathery tops of the palm-trees to the beautiful moonlit sea. It so happened that we had the place to ourselves, and something impelled me to open my heart to my gay, light-hearted friend, who yet seemed to be possessed of great good sense, and who had treated me with rare delicacy and kindness. So I told him all my story, and he listened patiently almost without remark till I had finished. 'Now,' I said in conclusion, 'what do you think I should do? I cannot leave the island till I have tried to justify myself; though I cannot see how I could have acted otherwise under the circumstances.'

'But did she understand the circumstances? that is the question.'

'What do you mean?' I asked, for I had not hinted that I had ever had the smallest suspicion that Mrs Moir had misled me.

'Well, you see, it was just this way, so far as I understand. You had been dangling after the young lady for some time, but had never come to the point. Now, many young fellows have a habit of hanging about a pretty girl with no serious intentions whatever, and with no object beyond a pleasant flirtation; and parents, especially mothers, don't like it. It may be a prejudice on their part, still the fact remains they do not like it.'

'But, my dear fellow,' I was beginning, when Preston waved his hand to enforce silence, and proceeded.

'Well, let us say you were not flirting; but your conduct would bear that interpretation. Then, furthermore, we will suppose that certain inquiries were made, and that it appeared you were not, as regards outward circumstances, in that enviable position which would induce prudent mammas to cultivate your acquaintance with any great enthusiasm. Then a wealthy and more eligible suitor turns up. He is none of your shilly-shallying sort, but makes his meaning clear to the powers that be from the very first; and nothing prevents him from going in and winning except a foolish prejudice on the part of the young lady in favour of the very undesirable young man who will neither speak out nor take himself off. Well, now, you see, from the mother's point of view it would be a very good thing if you could be got rid of; and "all is fair in love and war."

'Then you think that Mrs Moir told me what was not true, simply that she might get rid of me?'

'I think it is very likely; and small blame to

her if she did. I mean no offence, you know ; I speak merely as an impartial observer. The old lady no doubt thought she was doing her best for her daughter.'

'Then you would justify falsehood and double-dealing ! Your standard of ethics does not seem to be a very high one,' I said stiffly.

'Stop a bit, my dear fellow ; you must remember that you were not acting on the square yourself. Any fellow who dangles after a girl month after month and never speaks out honestly, as she and her parents have a right to expect, has very little reason to complain if he is left in the lurch in the end. By your own showing, you did your best to engage the young lady's affections, and then cruelly kept her in doubt and expectation. No sensible mother would allow her daughter to occupy such a humiliating position ; nor do fathers as a rule care to hold their daughters so cheap as to ask a young fellow the meaning of his attentions. I think if Mrs Moir practised deceit towards you, it was your own unjustifiable conduct that drove her to it.'

'One would think you held a brief for Mrs Moir, by the way in which you defend her.'

'I don't defend her at all. If she did as we suspect, she inflicted a great injury both on you and on her own daughter. But I want to point out that yours was the first fault, and that Mrs Moir's conduct was a direct consequence of your own.—Don't be cross, old man,' he said, taking out a fresh cigar and preparing to light it. 'If I am to suggest a remedy, we must look the facts fair and square in the face.'

'Then you don't think the case utterly hopeless ?'

'No ; indeed, I do not. You see, in the first place, she has not married the other fellow, probably because she did not care for him. Then she treats you with marked coldness, which shows she resents your former treatment of her ; and I think that unless she had cared for you a little, she would not have troubled herself in the least about meeting you again, and would have laughed over your past experiences.'

There was some comfort in this view of the case, for 'auld love is easy kindled,' as the Scotch say. I was considerably astonished at the shrewdness and worldly wisdom of my light-hearted young friend. I felt the justice of his remarks on my own conduct, and expressed my surprise at hearing such sage sentiments from one of his years.

'I don't go through the world with my eyes shut, and I have sisters,' he said significantly.

'Well,' I said, 'to come to the practical. What would you advise me to do ?'

'Hum ! It is not so easy to tell,' he said thoughtfully.

'I must have an explanation with her, and how am I to do that if she won't allow me to speak to her ?'

'I'll tell you what I would do, if I were you. I would take your cue from her, and since she does not wish to speak to you, avoid her as sedulously as she now avoids you. This will have the effect of making her lay aside her defensive armour ; and, then when an opportunity offers, you can be prepared to take advantage of it.'

'I don't know if you have the harmlessness of the dove, Preston, but you certainly are possessed

of the wisdom of the serpent. It is awfully good of you to bother yourself about my affairs, and I will try to follow your advice.'

'I wish you luck,' cried Preston ; 'and I hope things may come all right in the end.'

'I don't know,' I answered. 'I am not very sanguine. The first part of your advice can be followed without difficulty. It is easy enough to avoid people in this crowded hotel ; but how to get a word with any one in private is more than I can see.'

'Don't be down-hearted, old chap. Chance may favour you, when you least expect it, and if I can help you I will.'

In accordance with the resolution I had come to, I merely bowed to Miss Moir and her aunt when I met them at the breakfast table next morning, and neither then nor later in the day did I make any attempt to speak to her. Attracted by the cool splash of the fountain, I sauntered into the garden in the afternoon with a cigar and a novel. Louie and her aunt with Preston and two or three others were sitting in the shade thrown by a group of palm trees and eucalyptus.

'Come along, Grahame ; here is a seat for you,' cried Preston.

'Thanks ; I am going to smoke,' I replied, passing on to the other end of the garden.

I could hear their lively chat and merry laughter, and I recognised Louie's voice, the gayest of all. They were planning some excursion for the morrow, and Dick said : 'Perhaps the knight of the rueful countenance may be induced to join us ;' and turning towards me, he called out : 'I say, Grahame, are you open for a drive to Telde to-morrow ?'

'Are you making up a party ?' I asked, going towards them.

'Yes ; there are seven of us, and you would make eight—just enough for two conveyances. But don't come if you would rather not. Perhaps you would prefer to stay here and finish your novel,' he said, laughing.

'I shall be very pleased to join you,' I replied, but without any show of eagerness.

When we started on our expedition next morning, I waited till Miss Brown and Miss Moir had seated themselves in the one conveyance, and then I stepped into the other one. After leaving the town, the road led along by the sea-shore for some distance. It was a bright lovely morning, and the sea was of a deep sapphire blue ; giant rollers came sweeping majestically in, and dashed in snowy foam against the rocky coast with a deep thundering roar. Then the road ascended ; and passing through a tunnel, we drove along the edge of precipitous cliffs, where sea-birds build their nests, and fly screaming and circling above our heads, or dart down to the blue waves below. Far out over the sea, the mountains of Fuerteventura were faintly visible against the clear sky. Then the road takes a sudden turn, and the way lies over beds of scoria and lava, covered with cactus and euphorbia. Past a *caldera*, or extinct volcano, and we come to a small village, of which the whole juvenile population rush out and follow us, calling 'Cuartito, cuartitos,' flinging bunches of flowers into the carriages.

The three lean but active ponies which are attached to each conveyance soon leave our ragged

little pursuers far behind, and another turn of the road brings us in sight of the beautiful little town of Telde with its Moorish dome and groups of noble palm-trees—its white flat-roofed houses, half concealed by groves of orange and mango, bananas, peach, and other fruit-trees.

We have lunch at a *fonda*, or Spanish inn. Like all Spanish houses, it is built in a square, enclosing a piece of ground called the *patio*, laid out as a garden. It is shady with palm-trees, gay with flowers, and musical with the fall of waters; and here we desired them to serve our meal. After lunch, we walked down the *barranco* to the famous orange groves, where the rich golden fruit is found in the greatest perfection. We were walking back to Telde up the *barranco*, and Miss Moir, who had fallen a little behind, was botanising. I lingered also, but without speaking or appearing to take any notice of her. Indeed, I had hardly exchanged a word with her all day; and as Preston had foretold, she was less repellent in her manner towards me. She was climbing up the steep side of the *barranco*, or narrow ravine formed by the torrents rushing down from the hills. She was trying to reach some maidenhair fern, when she slipped her foot on one of the loose stones, and would have fallen had I not sprung forward and caught her.

'Those loose stones are not to trust to,' I said. 'I hope you have not hurt your foot?'

'Oh no; I think not. It was only a slight jerk. It was fortunate you were so near, or I might have had a bad fall among these rough stones and prickly cactuses,' she said, looking up at me; adding, 'I am sure I am very much indebted to you.'

'I am glad to have been of some assistance to you. But won't you sit down and rest for a little, till you see if your foot is not injured? and I will go and call the others; they cannot be far ahead.'

'Oh no; it is not necessary to alarm anybody. My foot will be all right presently. I will just take your advice, and rest for a little,' and she seated herself on a huge boulder.

I stood for a minute, thinking now was my chance if I wished to speak to her. I sat down and began, poking away the pebbles with my stick.

'Miss Moir,' I said, 'I was very much surprised, when I met you the other day, to find that you are not married.'

She flushed up, with a look of offence, but did not speak.

'Your mother told me,' I went on, 'that you were to be married to Mr Bremner.'

'My mother told you that?' she exclaimed, in a tone of intense surprise; and then, after a short pause, she asked incredulously: 'When did she say that?'

'Do you remember,' I said, turning to her, 'that evening when I met you at the floral fête? Mr Bremner was with you, and stuck to you like wax, and I could not get a word with you.'

'I remember,' she murmured.

'Well, it was just the next day that it was proposed I should go to the Cape. It was not expected that I should be absent more than a few months; and on my return I was to be taken in as a junior partner. Perhaps you may have

guessed,' I proceeded, 'what hopes I cherished at that time. I thought that you understood; but I did not like to speak to your father till I had a better position to offer you. The promise which had been made to me was just what I had been waiting for, and I resolved to lose no time in telling your parents all about my circumstances and my love for you. I could not leave the country without knowing my fate; and I may as well confess that I was pretty confident of success; but my hopes were soon dashed to the ground. I called that very afternoon and saw your mother; but before I had begun to speak of my own affairs, she told me that she hoped soon to see you married to Mr Bremner.'

'She surely did not tell you that I was engaged to him?'

'No; she did not say that exactly; but I remember her words distinctly enough; they fell upon me like a death-blow,' and I repeated Mrs Moir's remarks verbatim.

Louie did not speak; she only flushed painfully, and began nervously to pluck at a little tuft of flowers which grew beside her.

'I told your mother that I was going to Africa; but, as you may well believe, I could not speak of the hopes her cruel words crushed as ruthlessly as you crush those flowers. I could not trust myself to see you or speak to you; therefore, I did not call again before I left, which was within a week.'

Still Louie said nothing. She sat and plucked at the leaves and stalks near her, for the blossoms were scattered, bruised and broken, at her feet.

'I supposed the marriage had taken place,' I said, 'though I had not heard of it.'

'Mamma told me about your visit,' she said falteringly and without looking up. 'I never thought you would be so unkind as to leave without seeing me.'

Just then, we heard voices, and soon Miss Brown and Preston appeared coming down the path.

Louie pulled herself together, and called out in a cheerful voice: 'Did you think I was lost, auntie?'

'Well, my child, I was a little alarmed. I thought you might have fallen, or something.'

'I very nearly came to grief. If Mr Grahame had not caught me, I should have tumbled down among those cactuses and rocks.'

'Bless me, child, I hope you are not hurt?'

'Oh no. "Very nearly" never killed a man, you know,' she answered, laughing.

'I am afraid Miss Moir has hurt her foot,' I said.

'Not at all; it was only a slight twist. I can walk well enough now.'

'I suppose you succeeded in having it out with Miss Moir?' said Preston, when the ladies had gone on a bit. 'I exerted all my diplomacy to give you the opportunity; but I could not allay Miss Brown's apprehension a moment longer. I hope we did not spoil sport by returning too soon?'

'Oh no. I said quite enough. I do not think Miss Moir quite believed me at first. I am convinced her mother had wilfully deceived me; and it was no wonder she doubted the truth of what I said. She hardly spoke.'

'Poor girl! She is in a painful dilemma. To believe you was to convict her mother of falsehood.'

'And yet, I think she did believe me in the end,' I said in a low voice.

Miss Brown and Mr Preston had struck up a great friendship. He was such a good-natured, obliging sort of fellow; so kindly and courteous in his manners to her, that he had quite won the ancient spinster's heart. They had arranged a drive to San Mateo. 'It was so much better,' she said, 'to have the company of gentlemen, especially in the more distant excursions. Ladies are so dreadfully victimised, when there is nobody to protect them. The beggars alone are nearly too much for me.' Miss Brown was not of the strong-minded order of women.

Our route was in the opposite direction to that of the preceding day, and was more inland. The roads were mostly shaded by tamarisk, eucalyptus, and pepper trees. We passed vine-clad slopes, orange groves, palms, and sugar-canes. We travelled in the usual four-wheeled conveyance drawn by three ponies, and went swinging along at a great rate, though the way was nearly all up-hill. We never stopped till we reached the half-way house, where we rested for a little, and drank a glass of the muscatel wine for which the district is famous. On reaching San Mateo; we walked up to a waterfall to which we had been directed.

We were followed by about half-a-dozen small boys, most of whom wore only a tattered shirt. One or two had a ragged nondescript garment over the shirt; but the weather was warm, and they seemed comfortable. Two of the boys had been engaged by the driver to carry the luncheon-baskets with which we had been supplied from the hotel; and the others, having no other occupation on hand, had followed to see what was doing, and perhaps receive a share of anything that might be going. We tried to drive the supernumeraries away; but it was no use. They would stop for a minute when we had made ourselves quite hot with threatening pantomime, and the minute we turned away, they followed up as persistently as ever.

We soon arrived at the spot indicated, and the baskets were placed under a tree. The boys seated themselves close beside them, manifesting a great interest in the contents, having evidently invited themselves to luncheon; but as our would-be guests were neither clean nor savoury, we made them take up a position at some distance, where they sat and watched our every motion. One queer little chap with a solemn wizened face, which might have belonged to an old man more than to a child, attracted our notice. He was the smallest of the party, and wore a little cotton shirt and a waistcoat, or rather a garment which might have been a waistcoat, but was now only a varied assortment of holes, held in precarious unity by a shred or two of rag. This curious little oddity produced from some receptacle in his upper garment a small pinch of tobacco and a withered leaf. These he rolled into a cigarette; and producing a match, he lighted it and puffed away with evident enjoyment.

When we had finished, we waved the expectant youngsters forward to finish the good things;

but as their pell-mell rush showed there was likely to be a regular scrimmage over the baskets, we made them all sit down again, while we apportioned the viands in equal shares. Half a bottle of thin Canary wine was divided in the same impartial manner.

After lunch, we proposed to climb a little higher up the stream for the sake of the view; and it was not long ere my wily friend Dick had led the vigilant duenna off the track, and left Louie and me by ourselves, except for the ragged escort who persisted in keeping close at our heels. We sat down for a while to enjoy the lovely scenery, and our youthful bodyguard squatted down in a semicircle in front of us, evidently bent on studying the manners and customs of the strangers.

We had been silent for a while, and then Louie said: 'Mr Grahame, I think it right to tell you that I was not engaged to Mr Bremner; but what my mother told you was true in a way, for she was very anxious I should accept him.'

'And what did you?—I mean, were you?'—

'I did not care for him, and I refused him, though my mother was much displeased, for she had a very high opinion of Mr Bremner.'

I turned to her, and took her hand, saying: 'Tell me, Louie, have I for ever forfeited all hope of calling you mine?'

Her answer need not be recorded, but it was eminently satisfactory.

All this time the small students of human nature were gazing in round-eyed astonishment at beholding certain demonstrations which are seldom performed before an audience except in the theatre. The love-scenes on the stage are often rather trying to the spectators; but our audience appeared to be hugely delighted; they clapped their hands, and would have cheered if they had known how. They followed us back to the town; and when we drove off, after a liberal distribution of *cuartitos*, we left them as happy a set of tatterdemalions as were to be found on the island.

When I met Dick on our way back, he gave me an inquiring look.

'All right,' I said.

'I am uncommonly glad to hear it,' he replied.

But no further remark was made, for we quite understood that Louie would need to break the news gently to her aunt.

She was rather put about, poor old soul, for, as she said, she was responsible to Mr and Mrs Moir.

The two ladies intended to leave for home in another week, and we decided to let the *Coomassie*, which was now ready to put to sea, sail without us, and to accompany them on the homeward voyage. We spent the intervening days very pleasantly, visiting the Guanche caves, the Grand Caldera, and the various sights in the island.

We sailed for home on the appointed day in splendid weather, and had a delightful voyage till we entered the English Channel, when a dense fog enveloped us. The engines were slowed, and frequent soundings were taken. Two young fellows on board, who had been on a pleasure trip, were in what Mr Bunyan would have called 'doleful dumps,' because they had set their hearts on being in Liverpool in time for the 'Grand National' steeplechase, and the fog was likely

to destroy all chance of it. For my part I did not care how long the fog lasted, were it not for the risk of being run into. I felt that all my world was on board the steamer, and I knew not what might happen when we reached London. Louie was quite confident that her parents would give their consent to our engagement, but I myself could not help feeling rather apprehensive.

In the evening, a great cheer got up, and the young fellows came rushing down to tell us that Carnarvon Bay light was seen, that the fog was clearing, and we should 'do it yet.' The fog-horn was kept sounding out its warning for the most part of the night. Holyhead light is passed, and the deep-toned bell is heard from the shore. In the morning we are in the Mersey. The pilot has come on board. The sporting men are in the wildest excitement. 'We shall do it,' they cry; 'we shall do it!'

At last we are in. The sporting men settle with the Custom-house officers for some cigars, and are first ashore. The last we saw of them, they were waving their hats to us as they drove off in good time for the great event. We followed more leisurely, and in due time were dashing along in the London express.

Mr and Mrs Moir were both on the platform when we arrived in town. There was a little constraint in Mrs Moir's manner towards me; but she expressed her thanks for my attention to the travellers. Mr Moir shook me warmly by the hand, and hoped they would soon have the pleasure of seeing me at Clapham Park.

I called the following afternoon; and with the full consent of all concerned I was allowed to place on Louie's finger the half-hoop of diamonds I had brought with me; and in a few months I expect that a plain golden circlet will keep it company.

CLERKENWELL AND ITS ASSOCIATIONS.

'Sir,' said Dr Johnson to Boswell on one occasion as they emerged from Bolt Court into Fleet Street—'talk of prospects, sir! This is the most sublime and picturesque combination of objects within the periphery of our terraqueous ball.' A similar tribute of praise could not certainly be paid to Clerkenwell in the present day; and yet the prospect from the Well of the Clerks in early times must have been very charming, situated as it was on the skirts of the forest of Middlesex, while all around were gently-sloping hills, and limpid streams, fed by the many springs for which the neighbourhood was renowned. A writer of the time of Henry II. mentions among the excellent springs round London on the north, Clerkenwell, Holywell, and St Clement's Well, as being of most note; and most frequently visited, 'as well by the scholars from the schools as by the youth of the city when they go out to take air in the summer evenings.' At this time, too, it possessed 'fields for pasture, and a delightful plain of meadow-land, interspersed with flowing streams, on which stand mills whose clack is very pleasing to the ear.'

Once a year at least, the parish clerks of London assembled here 'to play some large history of Holy Scripture'—during the fourteenth century, when miracle plays were part of the religious life of the nation. In course of time, wrestling-matches and other feats of strength were added to the attractions of Clerkenwell, and continued to draw large audiences in the days when miracle plays were a thing of the past.

Few things are more curious in the history of London than the freaks of fashion with regard to locality. The dreary and commonplace aspect of the dingy brick houses, mostly built at the close of the last century, which characterises the clock-making neighbourhood of to-day, makes it difficult to realise that the vicinity of the Well of the Clerks was still a village in the reign of Elizabeth, but fast becoming a favourite spot for the suburban residences of the noble and wealthy classes. The names of the streets and courts still keep the legend alive, although fashion has long since deserted Clerkenwell, as it has deserted Bloomsbury and Soho. Yet in St John's Square in 1661 lived Charles Howard, first Earl of Carlisle, one of the governors of Jamaica. Here, too, lived about the same period the Earl of Essex, at one time Viceroy of Ireland. Suspected of complicity in the Rye House Plot, he was confined in the Tower, where he died by his own hand. Lord Townshend, one of the five Commons deputed by Parliament to go to Holland to beg the return of Charles II. to his loving subjects, had a house here; and on the west side of the square Bishop Burnet, the celebrated author of the *History of his own Time*, passed some portion of his life, and lies buried in the parish church of St James. His life was passed in the midst of stirring times, and was of a most eventful character. Born in Edinburgh in the year 1643, during his long career he experienced every vicissitude of fortune. At one time we find him in France, sharing the fate of exile with Algernon Sidney and Fletcher of Salton, being well received by Louis XIV., and counting among his friends such men as Condé and the eloquent Bourdaloue and Père La Chaise. Again, when no longer a *persona grata* in France, he retired to the Hague, and there enjoyed the favour of William of Orange. He was one of those who landed with that Prince at Tor Bay; and when William was established on the English throne, was finally rewarded with the Bishopric of Salisbury.

Clerkenwell Close reminds us of that gentle knight, Sir Thomas Challoner, who, like Burnet, passed an eventful life, and died in the house he had built himself at Clerkenwell. As a diplomatist, he had been on an embassy to the court of Charles V., had accompanied that emperor to Algiers, and nearly lost his life on the coast of Barbary in 1541. A few years later, he fought at Pinkie (near Musselburgh), and received the honour of knighthood on the field of battle.

Newcastle Place is built on the site of the suburban residence of the Dukes of Newcastle. Of this family the most celebrated was the William Cavendish who enjoyed the favour of James I., and followed the fortunes of his son. After the battle of Marston Moor, he left England and spent eighteen years in exile on the Continent, living while at Antwerp in a house owned by the widow of Rubens. His wife, Margaret, was of a literary turn of mind, and something of a blue-stocking. Even her husband forgot his usual reverence for her erudition on one occasion when he said to some friend who was extolling his wife's learning: 'Sir, a very wise woman is a very foolish thing.' She was wont to be surrounded by a bevy of damsels, whose business was to write down her passing thoughts by day; and if a sudden inspiration seized her at night, her luckless footman, 'John,' was pressed into the service. Two lines from her works will give an idea of her curious conceits in the way of metaphor. She thinks

Life scums the cream of beauty with Time's spoon,
And draws the claret wine of blushes soon.

Her memory is immortalised for us in the pages of *Peveril of the Peak*.

Few places in the metropolis are so haunted with memories of the past as the site of the Priory of the Knights of St John of Jerusalem. The famous old gateway still frowns down on us—the sole relic of the medieval grandeur of the home of the Hospitallers. With their history we are not now concerned. But the Gate of St John has other associations. From here, Edmund Tylney licensed as many as thirty of Shakespeare's plays. Here, in later days, Edward Cave set up as a printer and started the *Gentleman's Magazine* on its prosperous career. At the Gate, Dr Johnson was a frequent visitor, and here, we are told, when strangers called, he ate his plate of victuals behind a screen, sensitive of the ridicule his shabby clothes might entail upon him. Here, one is glad to say, the genius of the rough but ever kind-hearted philosopher found eventual recognition. In a room over the gateway, Garrick made his début as an actor in an amateur performance of Fielding's *Mock Doctor*, his fellow-actors being Cave's journeymen.

A celebrity of the last century lived in Aylesbury Street, Clerkenwell; this was Thomas Britton, the 'musical small-coal man.' Born in Northamptonshire about the middle of the seventeenth century, he became apprenticed to a vendor of small-coal in St John Street, Clerkenwell. In 1677 we find him master of a stable with two stories, the lower of which he used as a coal-shop, while the upper formed a long low room, to which access was gained by a ladder-like staircase from the outside. In 1678 he here established his musical club, which continued to meet on Thursdays for nearly forty years. Up the rickety stairs the beautiful Duchess of Queensberry was not ashamed to climb to hear the first violin players of the day perform, or listen to Handel bringing forth matchless music from the organ. The admission to the concerts seems to have been at first free; but afterwards the subscription to the club was ten shillings a year, and the members were regaled with coffee 'at a penny the dish.' Not only learned in coals and music,

Britton dabbled in chemistry and alchemy, and had a fine taste in books. Noble book-hunters, and seekers after rare editions, such as Harley, Earl of Oxford, Lord Pembroke, and the Duke of Devonshire, either came to his house in Clerkenwell or met together at Christopher Bateman's, in Paternoster Row—Britton still wearing his blue smock, and with the coal-sack which he had been carrying about the streets all the day, over his shoulder. He continued, in spite of his musical and literary tastes, to sell small-coal until his death.

The names of Great Bath Street, Cold-Bath Square, Spa Fields, and the like, remind us of the days when drinking the waters was so much in vogue. In 1697 a spring was discovered in Cold-Bath Square by a certain Walter Baynes, and was made by him into a source of considerable profit. A bath-house was erected, which was open from five o'clock in the morning until one in the afternoon. The charge was two shillings; but by payment of sixpence extra, persons in feeble health might use a chair, which was suspended from the ceiling in such a manner that it could be lowered into the water and drawn up again. In this square, at a later date, lived poor Eustace Budgell, the friend of Addison, who sought a melancholy death in the Thames, his mind being partially unhinged by the worry of litigation and by losses in the South Sea speculation. He left a paper on his desk with the words, 'What Cato did and Addison approved cannot be wrong.'

Taking the waters then, as now, was attended by a good deal of merry-making and amusement. The proprietor of a place of entertainment 'near the New Wells by the London Spaw,' in 1745 added an amusing note to his programme of attractions: 'The proprietor being informed that it is a general complaint against others who offer like entertainment that if the gentle zephyrs blow ever so little the company are in danger of having their viands fanned away through the thinness of their consistency, promises that *his* shall be of such solidity as to resist the air'—referring, doubtless, to the proverbial thinness of a 'Vauxhall slice.'

Other famous places of resort in the neighbourhood were Sadler's Wells and Bagnigge Wells. Nell Gwynne had once a summer residence at Bagnigge Wells House. About the year 1680 it became a place of entertainment. Nearly a century afterwards, a mineral spring was discovered, and for many years Bagnigge Wells enjoyed great popularity. About 1775 we learn that one of the characteristics of 'bon ton' was

Drinking tea on summer afternoons
At Bagnigge Wells with china and gilt spoons.

Miss Edgeworth in one of her *Tales* also alludes to this spot—

The City to Bagnigge Wells repair
To swallow dust, and call it air.

Bull and bear baiting, cock-fighting, and similar amusements, attracted large audiences during the early years of the last century to a spot in Clerkenwell bearing the ill-sounding name of Hockley-in-the-Hole. A handbill for the year 1710 will give some idea of the kind of entertainment

which was provided: 'At the Bear Garden in Hockley-in-the-Hole.—This is to give notice to all gentlemen gamesters and others that on the present Monday is a match to be fought by two Dogs, one from Newgate Market against one from Honey Lane Market, at a Bull for a guinea to be spent. Likewise a green Bull to be baited which was never baited before, and a Bull to be turned loose with Fireworks all over him. Beginning exactly at three of the clock.' These sports caused considerable scandal to the more respectable inhabitants of Clerkenwell, and frequent endeavours were made to put a stop to them, but without much avail. The spread of education and the gradual softening of manners proved the only real remedy.

Strong men, then, as now, created a considerable amount of interest. One of these celebrities, Topham by name, lived in Bath Street in 1741. One of his feats was that of lifting three hog-heads of water, weighing over eighteen hundred pounds; and a story is told of him that one night, finding a watchman asleep in his box, he raised both from the ground and dropped them over the wall of Bunhill Fields burying-ground!

Clerkenwell is especially the home of the clock and watch making industry. In the early years of the last century many persons employed in these trades took up their abode there. The celebrated painter, Charles Robert Leslie, was the son of a clockmaker living in Clerkenwell; and in 1721, Christopher Pinchbeck resided in Albion Place, where he invented his astronomico-musical clocks. In a house at one time tenanted by the father of John Wilkes, lived Colonel Magniac, who employed himself in making automaton clocks for the Emperor of China.

There is no loneliness so complete as that experienced by a stranger in a large city, and to those who wish to be let alone by their fellow-creatures, the great world of London offers more attractions than the country. Misers and eccentric persons of all descriptions have always, therefore, been found in the metropolis in considerable numbers, and in no part of it, perhaps, more than in Clerkenwell. Here lived the eccentric centenarian, Mrs or 'Lady' Lewson, who for many years before her death (1816) had always appeared dressed in the garb of a century previous, when 'Life was hers, and hope was young.' Another eccentric character was the miser Cooke, who was wont to ask persons he called on to put a little ink in the bottle he always carried about with him. He used generally to add that he had no objection if they filled it! At his death, he left a very large fortune. A curious case of mental aberration produced by the pride of place and riches was that of Elizabeth, Duchess of Albemarle, who lived at Newcastle House, Clerkenwell. After her husband's death in 1698, she resolved never again to give her hand to any but a sovereign Prince. She accordingly rejected all her suitors until Ralph, Duke of Montague, won her hand, coming disguised as the Emperor of China!

Did space permit, mention might be made of many other worthies in Clerkenwell's roll of fame. As it is, a few notes on the historic Red Bull Theatre must suffice. On the site of Woodbridge Street, the old Red Bull was a famous

theatre in the time of Shakespeare, though we have few details of the performances there. Edward Alleyn, the founder of Dulwich College, once trod its boards. Its fortunes underwent many vicissitudes in the times of the Puritans; but at the Restoration, the King's Players acted here for some time until they removed to their new theatre in Vere Street, Clare Market. Pepys did not think much of the management of the theatre at this period, for in his 'Diary' for the 23d of March 1662, he says: 'To the Red Bull, where I had not been since the plays came up again. Up to the tiring-room, where strange the confusion and disorder that is among them in fitting themselves, especially here, where the clothes are very poore and the actors but common fellows.' He goes on to say the house was anything but full, and the play badly acted; and he tells us that a boy that was to sing a song, not singing it right, 'his master fell about his ears and beat him so that it put the whole house in an uproar.' 'The Red Bull,' says Sir William Davenant in 1663, 'stands open for fencers, for there are no tenants in it but spiders!' Such was the end of the old Red Bull Theatre, which, like the 'Globe,' had 'seen its day,' and outlasted the golden age of the English drama.

PUSSY'S NOTABLE FRIENDS.

FOLLOWING in the wake of Buffon, writers of Natural Histories are pretty unanimous in setting down the cat as an animal incapable of personal attachment; yet Puss has contrived to win the friendship and affection of many notable men. The skull of Morosini's favourite cat is still preserved among the relics of that Venetian worthy. The counterfeit presentment of Andrea Doria's huge spotted pet contemplates the Doge with mournful tenderness on the canvas, as he was wont to do when both were in the flesh. Sir Henry Wyat's gratitude to the feline friend who saved him from starving in the Tower by bringing pigeons for his sustenance, caused him ever afterwards to make much of his purveyor's kindred, and we are told, 'you shall not find his picture anywhere, but, like Sir Christopher Hatton with his dog, with a cat beside him.'

Having exhausted his credit with the candle-dealers, Tasso besought his cat to aid him with the light of her lustrous eyes. Cowper commemorated his sedate favourite being shut up in a drawer; gloried in saving her becoming the victim of her philosophical inquiry into the nature of a viper, by decapitating the intruder with a handy hoe; and thought Lady Hesketh could not withstand an invitation to come and see a tortoiseshell kitten given to indescribable gambols, 'the drollest of creatures that ever wore a catskin,' ere Time, that spoiled all things, turned her into a cat. When Horace Walpole bewailed to Gray the loss of his handsomest cat, the poet condolingly replied: 'I know Zara and Selima, or, rather, I knew them both together, for I cannot justly say which was which. Then as to your handsomest cat, I am no less at a loss, as well knowing one's handsomest cat is always the cat one likes best; or if one be alive and the other dead, it is usually the latter that is handsomest. Besides, if the

point were never so clear, I hope you do not think me so ill-bred as to forget my interest in the survivor. Oh no! I would rather seem to mistake, and imagine to be sure that it must be the tabby one.' It was the tabby one; and in the hope of immortalising Mademoiselle Selima, Gray sent Walpole an ode recording how Selima, tumbling from a 'lofty vase's side' into a tub of gold-fish—

Eight times emerging from the flood,
She mewed to ev'ry wat'ry god
Some speedy aid to send.
No Dolphin came, no Nereid stirred;
Nor cruel Tom nor Susan heard.
A fav'rite has no friend!

Upon Gray's death, Walpole memorialised poet and puss together by placing Selima's vase upon a pedestal inscribed with the opening stanza of the ode.

Advising Miss Susannah Thrale to read Bickerstaffe's account of his cat, Dr Johnson wrote: 'I could tell you as good things of Lily, the white kitling, who is now in full growth and very well behaved.' Speaking to Langton of the desperate state of a young scapegrace of good family who was running about town shooting cats, the Doctor muttered: 'But Hodge shall not be shot; no, no, Hodge shall not be shot!' Hodge was the cat for whose delectation he fetched oysters. Seeing the favoured creature scrambling up his master's breast, while, half whistling, the smiling Doctor rubbed its back and pulled its tail, Boswell, smothering his antipathy to the feline race for the nonce, remarked that Hodge was a fine cat. 'Why, yes, sir,' replied Johnson; 'but I have had cats whom I liked better than this,' adding, as if he feared Hodge might be offended, 'but he is a fine cat, a very fine cat indeed!' Equally considerate of his cat's feelings was Sterne. Writing from Coxwold to his well-loved daughter, he tells her: 'As to my pleasures they are few in compass. My poor cat sits purring beside me. Your lively French dog shall have his place on the other side of my fireside; but if he is as devilish as when I last saw him, I must tutor him, for I will not have my cat abused.'

Scott's love of dogs did not prevent his delighting in the company of 'a conversable cat,' like the big gray puss who was almost as important a member of the Abbotsford household as Maida herself. His grave interested demeanour when listening to his master reading the old romance of Arthur to Washington Irving, impelled his fellow-auditor to observe that he evidently had a taste for black-letter literature. 'Ah,' said Sir Walter, 'these cats are a very mysterious kind of folk; there is always more passing in their minds than we are aware of: it comes, no doubt, from their being so familiar with warlocks and witches.' Then he told the story of the guidman who told his guidwife that he had met a funeral procession of cats on his way home; whereupon the family cat exclaimed, 'Then I am king of the cats!' and vanished up the chimney. 'Our grimalkin here,' added Scott, 'reminds me of the story by the airs of sovereignty he assumes; and I am apt to treat him with respect from the idea that he may be a great prince incog., and some time or other come to the throne.'

Bentham did not dream of his feline companion attaining quite so high a dignity. On his first

coming he had christened him Langbourne; but as he developed in width and wisdom, the philosopher dubbed him, 'Sir John Langbourne'; and when advanced years brought increased gravity, inducted him into the Church, to die in full possession of all his faculties and be mourned as the 'Rev. Sir John Langbourne, D.D.' Josh. Billings resented the suggestion that 'William' was too dignified an appellation for his favourite, and insisted that such a special blue-blooded specimen of the feline critter deserved a dignified name, adding: 'Poor old man! he has had fits recently; and now I call him Fitzwilliam!'

When Pius IX. sat down to dine, his cat came in with the soup, mounted a chair opposite him, and dumbly and decorously looked on until the Pontiff had finished his meal. Then it received its own at its master's hands, and took leave till the same hour the next day. The demise of puss alarmed the Pope's household, lest he should be painfully affected by the loss of his old table companion; but His Holiness 'did not seem to care a bit more about it than he had cared for the death of his Secretary, the Cardinal Antonelli.' A much more pronounced cat-lover was the Abbé Galiani, who declared his life at Naples would have been unbearably dull but for the companionship of his two cats, of such value in his eyes, that losing one through a servant's negligence, the Abbé made a clean sweep of his household, vowing he should hang himself in despair if the lost one were not recovered, which, fortunately, came about in time to avert such a catastrophe. Lamenting the passing away of his friend the Archbishop of Taranto, Sir Henry Holland says: 'His cat and the Archbishop, sitting together as they generally did, made a picture of themselves, the former looking the more austere theologian of the two.' A friend visiting Bishop Thirlwall in his retirement, thinking he looked uncomfortable and weary, asked why he did not sit in the easy-chair. 'Don't you see who is there?' was the reply of the Bishop, as he pointed to a big cat fast asleep on the cushion. 'She must not be disturbed.' The great Churchman preferred his cat's comfort to his own, like Mohammed, who cut off the sleeve of his robe rather than interfere with the repose of his beloved Muezza.

Razzi the painter's Angora cats shared his affection with a troop of squirrels, monkeys, goats, and asses. Mind, the 'Raphael of cats,' loved cats only, and did not care how many he had about him. His special pet was always at his side when he worked, to be talked to and answer in cat language. When an epidemic of madness broke out among the feline population of Berne, the police killed every cat they could find; but Mind contrived to hide his pet until all danger was past. While rejoicing at her escape, he never forgot or forgave the massacring of his favourite animals, for his love extended to the whole race. That apparently was the case with Harlequin Rich, for when pretty Peg Woffington succeeded in obtaining audience with him, she found Rich lolling on a sofa, with a cup of tea in one hand, a playbook in the other, and seven-and-twenty cats of all ages, sizes, and colours bearing him company; some on the floor, some on his knees, some perched on his arms, others on his shoulders, and one cleverly balanced on his head.

Although it was a Frenchman who declared a

love of cats to be a vice of inferior minds, and that no man of taste ever could have any sympathy with a beast passionately fond of asparagus, our neighbours have taken kindly to puss. If he did not particularly care for cats, Richelieu delighted in kittens, and Colbert shared his fancy. Chateaubriand loved the cat for its independent spirit; and when he lodged with Widow O'Leary in London, he mourned with his landlady on her losing two lovely cats, as white as ermine, with black tips to their tails; and he always blessed his embassy to Rome, because Leo XIII. then made him the proud possessor of Micetti, a big grayish-red cat, which he loved and cherished to the end of its existence. Victor Hugo kept a warm corner in his heart for his lazy Chanoine. Paul de Kock's Frontin was a beloved home companion for eleven years. Montaigne thought out his essays while stroking his tabby's fur. No one in St Beuve's establishment dared touch his writing-table, but his cat was privileged to do as he willed amid its piles of papers. Beaudelaire could not see a cat in the street but he must coax it to come to his arms; and visiting a house for the first time, he was not happy until he made the acquaintance of the cat pertaining to it.

Lover of all things fair, Theophile Gautier had a passion for cats, born in boyhood, when his gray cat used to bite Madame Gautier's legs whenever she took her son to task. No gift was so acceptable to Gautier as a cat; but he was fairly alarmed when he received a white Angora, 'a veritable Apollo.' He said he should not dare to offer it anything but white mice. His cats were given grand names—Zobeide, Zuleima, Zuleika, Cleopatra, Zi-zi, were some of them. Childbrand was a splendid tawny, black-striped specimen. A red-coated, white-breasted, pink-nosed, blue-eyed beauty was named Madame Theophile because she walked with him in the garden, reposed on his arm indoors, and slept at the foot of his bed. She had a weakness for patchouli, and delighted in hearing her master's lady-friends sing; but invariably closed their mouths with her paw if they attempted a note too high for them. Another of his special pets was a white cat, named Don Pedro de Navarre, a cat much interested in his owner's pursuits, who would turn over the leaves of a book and then fall asleep, 'for all the world as if he had been reading a fashionable novel.' The Don never retired to rest till Gautier came home, meeting him at the door, and preceding him to his bedroom. As soon as he was between the sheets, up jumped the Don, took Gautier's neck between his paws, rubbed noses while uttering little cries of affection, and then perched himself on the bedhead and slept like a bird on a branch. He was provided with a spouse in the dreamy, contemplative, snowy Seraphitas; but the pair died all too soon, and the White Dynasty was succeeded by the Black Dynasty—three black beauties, the offspring of the white pair. They bore the names of Enjolras, Gavroche, and Epinone. The first named was a magnificent cat of slow and majestic movements; Gavroche was of Bohemian temperament, fond of low company, and given to the amiable weakness of inviting starved strays to partake of the good things provided for himself. Epinone was a perfect lady, who received visitors, conducted

them up-stairs, and amused them till Gautier relieved her, when she retired to the corner of the piano, and listened to the conversation without interrupting it. She took her seat at table, and went regularly through the dinner from soup to dessert; but if she found knife, fork, and spoon laid in her place, Epinone betook herself to the piano and quietly looked on. Naturally, this model cat lived beloved and died lamented. Gautier's artist cronies were fond of caricaturing him and his pets; but he told them cats were quite beyond their pencils: they might draw men and women—mere talent sufficed for that—but to portray a cat required genius.

Chesterfield provided for his cat by will; and Sir George Bowyer desired the inheritors of his property to protect his church and convent at Abingdon, hoped they would remember his poor people, and expected them to take care of his cat. Even that utter scoundrel, Thomas Griffiths Wainwright, loved his cat, and we may take it for granted the attachment was reciprocated—his pet being the exception proving the rule laid down by Oliver Maddox Browne, that it is an impossibility for a cat to form an enthusiastic friendship with a person of utterly vitiated and unprincipled morals.

BIRD-MUSIC.

Oh, sweet the thrush's song
From the tall lime's retreat;
No sound of flute or human voice
Was ever half so sweet.

What means that wondrous note?
I sit and ponder long.
All Nature's varying moods and life
Seem uttered in the song:

The thoughts of grass and flower;
The scents of new-mown hay;
The mystic murmur of the winds
Which 'mid the branches play;

The words of the green leaf;
The odour of the air;
The gleaming of the evening dew;
The love of all things fair;

The soft laugh of a child;
The cry of heart that bleeds;
The shadow of a summer cloud
Upon the summer meads;

The rifts of soft sunshine;
The sweet rush of the rain;
The colour of the daffodil—
They all seem in that strain.

Oh, wondrous burst of song!
Its central note is Love,
And all sweet fancies of the soul
Around it seem to move.

MODERN CREDULITY.

IN spite of improved education and the diffusion of knowledge through an ever extending printing-press, there is an amount of simplicity among us that may be described as perennial in its greenness. This is best seen in the twofold forms of superstition, and credulity with respect to the pretensions of charlatans and impostors of every description. There are few minds, even in these scientific days, which are wholly free from superstition. It will generally be found that every man has some pet superstition of his own, however he may laugh at those of his friends. The old belief in apparitions seems only to have taken a new departure in the modern form of spiritualism.

To turn back after once setting out, spill salt, walk under a ladder, sit down thirteen at dinner, are still considered unlucky omens. Such superstitious fancies are widespread and die hard. They have a powerful hold on the minds not only of the ignorant of all nations, but of those whose education and experience might be expected to relieve them of all such notions. In Yorkshire, to break a looking-glass is still believed to entail seven years of trouble. In Cornwall, no miner whistles underground; while in many places, pixies, fairies, and brownies are yet regarded as existent beings.

According to feminine fancies, it brings luck to separate men when you meet several together, but quite the reverse to walk between two women on the pavement. To dream of ivy is still considered very favourable, and indicates good weather should you undertake a voyage. Good fortune is ensured if you sneeze on a Saturday; but we must beware of marriage on that day, Wednesday being considered the luckiest. The last day of December is a favourite wedding day in some places. A bride should avoid wearing green colours, as being emblematical of evil. In western counties, Sunday is regarded as an especially lucky day for births. In Devonshire you mustn't wash clothes on New-year's

day—and so on through the whole catalogue of cautions.

On Ascension day, Lord Penrhyn's extensive Welsh quarries are closed, because an idea prevails among the quarrymen that if they work on this holiday some fatal accident will occur. Good-Friday buns are sometimes kept through the year for good-luck. In the north of England, women still wear round their necks blue woollen threads till they wean their children, for the purpose of warding off fevers. It is not so long since a woman, arrested for theft, when searched at the main Bridewell, was found to be wearing a horseshoe 'with nails complete'—for luck, which on that occasion seems to have deserted her. From the pocket of a burglar, searched at Bow Street, was taken a lump of coal, which, the police explained to the astonished magistrates, is usually carried by these midnight prowlers as a sort of talisman to ensure their safety, just as many persons still believe in the efficacy of certain gems. It was noticed that a number of Russian officers in the last war with Turkey wore turquoise rings as 'a means of protection against a violent death.'

Faith in the life-saving virtues of a caul is still prevalent. Rather recently, a case occurred, however, tending to explode this idea. At the inquest on the body of a man found drowned in the Thames, it transpired that the deceased used to boast that he would never be drowned, as he had been born with a caul. In a certain neighbourhood of the same river, night-poachers have a great fear of 'being pelted with human bones.' There is a hole there in which are said to lie the remains of scores of people who were murdered by highwaymen, and thrown in enclosed in weighted sacks. Poachers declare that they have fibulas hurled at their heads if they venture in that district.

Sailors are not the only class who associate the harmless necessary cat with dire portents. Some actors have implicit belief in pussy as an augur of good or evil. The success of that laughter-provoking piece, *The Private Secretary*, is said to

have only been really assured after a black cat chanced to put in an appearance at one of the rehearsals. In fact, no business or profession seems to be entirely free from being influenced by some sort of fetish. Gamblers are notoriously superstitious, and profess to foresee revelations of luck in a great variety of odd ways, but especially in dreams. Their belief in the significance of numbers is marvellous.

In Florence, the dread of the number thirteen is so great that it is absent from many streets, the numbers skipping from twelve and a half to fourteen. In Naples, the date on an old tombstone, a flock of birds, or the number of shadows cast by the moonlight through the iron bars of a gate, send away scores of wretched noodles to invest their last few coins in lottery tickets, in the full assurance that winning numbers have been revealed to them. Similarly, the French are not much wiser in this respect. A son-in-law is confident of winning half a million francs if he can only secure a ticket the last two figures of which shall represent the age of his wife's mother. Another man bases his hopes of gain on the coincidence of numbers with the respective ages of himself, his wife, and three children. Human folly is the same in all countries; and were the State to permit lotteries here, it is certain that the same heathen reliance on just such Mumbo Jumbo would be manifested.

Then, consider the importance of colours with regard to one's hair and complexion as shown in the custom of 'first-footing' every new year. Imagine the villain of the play with fair locks, eyebrows, or beard! Yet the great Napoleon is said never to have trusted a general who had light hair or moustaches. One of the richest men in America is reported to confide in clerks and others in proportion to the darkness of their complexions. The power of 'overlooking'—the magic influence of the 'evil-eye,' and other uncanny attributes, are to this day thoroughly believed in by the Irish peasantry.

In certain parts of Scotland, the people entertain a great horror of the mere mention of swine. Not very long ago, in Inverness, the small clay effigy of some obnoxious person, as used in witchcraft, was produced in court in evidence against some modern wizard. Witnesses testified to the deaths of cattle and illness of peasants through this revival of the black art.

Lately, in the Thames police court, it came out that a woman who had lost a shawl tried to discover the thief by the ordeal of 'the Bible and the key,' a test which 'never failed.' Before invited witnesses, she laid a Bible on the table, and placed a key, to which a string was attached, between its leaves. She held the projecting part of the key, pronounced several neighbours' names, and repeated some doggerel invocation, till at mention of the guilty name the key 'twisted itself out of her hand and fell on the floor.' In the same manner she averred that the name of

the pawnbroker was obtained with whom her shawl had been pledged.

After such revelations, can we wonder that prophetic calendars find thousands of annual purchasers, or need we be surprised that the law frequently fails to protect silly dupes from the wily snares of fortune-tellers?

To consider further evidences of modern credulity, what thinks the reader of chemists in our times being applied to for mystical remedies, as if the days of necromancy were not over? A young woman who was crossed in love wrote to a London chemist for a love potion, which she believed would bring back the roving affections of her fickle swain. The chemist was requested to 'mix a good strong one, as it was for a farmer who was considerably over six feet high, and broad in proportion.' This was not the first of such curious applications he had to refuse. In Somerset, a dairyman whose cows showed a decrease in their yield of milk concluded that he was 'overlooked,' and betook himself to a 'wiseman,' to whom he paid a guinea down, and agreed to keep him at the dairy at the pay of one pound a day and maintenance till the spell was exorcised.

There are striking examples to prove how easy it would be to make a rapid fortune by pretensions to some sort of uncanny powers, did not wise legislation place certain little obstacles in the way of such enterprises. Feminine curiosity with respect to gypsy fortune-telling is well known. But one expects a farmer in these days to have better sense than to proceed to a gypsy camp, as did one lately, for the purpose of getting his 'planet ruled.' It was the old story of a fool and his money soon parted. The fees demanded from time to time were wrapped up in a handkerchief, and some 'dragon's blood' in a dried state grated on it. He was lured on with promises of shortly becoming the possessor of some property, and was shown a tumbler in which was some liquid, and on looking into it he saw what appeared to be some houses floating therein. At the gypsy's request, he threw the contents of the glass over his left shoulder into the fire. After parting with over one hundred pounds, he found the gypsy camp suddenly abandoned, and took his story to the nearest police office for advice and consolation.

Since commencing this article, a curious case has occurred which bears on our subject. A youth was taken suddenly ill, and the parents, instead of sending for medical assistance, applied to a 'sommambulistic woman,' who mixed some patent potion of her own, which was administered to the patient with the result that he died in horrible agony the same night. At Salisbury, another woman got herself into trouble through setting up as a 'divinity' and professing to read the destiny of a female dupe 'through a piece of thick glass,' for several pecuniary considerations. The foolish applicant became at last so much under the influence of this crafty 'sorceress,' that her mind grew affected.

But a greater adept than she at the mystery business now claims our attention, Methrattton, the Great Seer of England, Astrologer, Grand-master of the Mysteries, &c. An examination by

the police of the letters and documents in his possession proved that the 'prophet' had been doing an extensive and lucrative business. His fees for talismanic advice varied from sevenpence for 'seven years future' to fifty pounds for the 'elixir-of-life secrets.' His correspondence revealed an amount of credulity among the public enough to dishearten the most philanthropic optimist. Unhappy married people would be pleased to be foretold of the early deaths of their uncongenial partners. One gentleman wished to know how long his mother would live, from whom he had great expectations; while a lovesick maiden sent a remittance in order to be told how she could obtain the affections of a certain young man. 'Would the astrologer control the planets so as to draw her and her beloved together, as they lived fifty miles apart?' The talismanic charms were in great demand, and must have been very profitable, considering that a sheet of crown paper would cut up into about eight pounds' worth of the said prophetic emblems.

With such examples of modern credulity in free and enlightened England, it is not so surprising to hear that recently in Russia a peasant was relieved of all his money by the simple expedient of three 'venerable-looking men, dressed in clerical fashion,' calmly informing him that they were three of the apostles. 'We have given you wealth, but you have omitted to exercise charity.' At these words, the trembling victim fell on his knees, begged for mercy, and gave up five hundred silver roubles—all the money he had in the house.

Some humorist suggested as the best allegory of Faith—a bald-headed man investing in a bottle of hair restorer. The public credulity with regard to new patent panaceas is positively touching.

Advertisements offering absurd remedies for any defects of nature meet with instant success. It is only the other day that an amusing illustration of this form of modern gullibility was seen in France. With the feeling that there is nothing so perilous for popularity as obesity, an actress found promise of relief in a doctor who had introduced 'massage' into his practice. He offered to reduce Mademoiselle to sylph-like proportions. She underwent the shampoing process two hundred and thirty-five times, the protracted energy of the medical man being only equalled by the sublime faith and patience of the actress. But alas! in the end she was no thinner, and dismissed him, after paying six hundred francs.

Specimens of the pitfalls always yawning for the unwary through the medium of advertising swindles would fill volumes as they at present fill many newspapers. One example in conclusion will suffice. As the result of a wager between some French journalists that human credulity had no limit, the following announcement was published: 'I Promise Nothing; I Engage to Perform Nothing. But send one franc fifty centimes in postage stamps. Perhaps there is a little surprise in store for you. Who knows? Address, "F. D." Post-office.' The impudence and apparent candour of this cool appeal to the public met with every success. Stamps rained in for several days, so that the winner of the wager was able to hand over a substantial sum to a local charity, after which he told the story in the

newspaper, so that the dupes might know what had become of their money. How true is the saying, 'People love to be taken in,' for in such cases experience teaches nothing.

A SOLDIER AND A GENTLEMAN.*

CHAPTER X.—'THE BEST-LAID SCHEMES O' MICE AND MEN'

FERRERS' feeling, however, speedily underwent another fluctuation. All the party met at breakfast; but Dolly had neither word nor look for Ferrers: her regard was wholly given to Lord De-brett. Ferrers was hurt, and a little jealous, not understanding that a woman has eyes and sense in the back of her head, and, while appearing engrossed with one, is truly observing and comprehending the whole behaviour of another. He conversed with Drew and Drumly; but he scarce knew what he said, for his eyes and his thoughts were given to Dolly.

When breakfast was over he felt he could endure it no longer: he *must* know how he stood. He followed Dolly from the room and caught up with her as she was crossing the hall.

'Miss Dawlish,' he said.

She turned and looked at him as if she scarcely knew him, and he felt chilled and daunted.

'Won't you come out into the garden for a little?' said he.

'I was just going,' she coldly answered.

He got her hat and his own from the hat-stand, and together they went out.

'I was in the garden soon after six this morning,' said he casually.

'Why did you get up so early?' she asked, as with indifference, while she paused to pluck a rose, which she found she could not accomplish without the aid of his knife. 'Had you a bad conscience?'

'Yes,' he answered; 'a very bad conscience.'

'Why?' she asked, still without looking at him.

'For one reason,' said he, 'because I failed to keep an appointment last night with'—'the dearest girl in the world,' he was going to say—'a young lady,' he really said.

'And why did you do it?' she demanded, at length looking at him. 'Are you not ashamed of yourself?'

'No; not ashamed,' said he: 'sorry—sorry because I couldn't help it.'

'Couldn't help it?' she echoed, turning with a look of frank astonishment. 'I really believe it was that you didn't care a bit to come. You thought it was bold in me to ask you, and you wanted to make me feel it was. You have been very unkind!'

'You misunderstand me altogether,' said he, almost beside himself with her evident distress. 'I am not unkind: you do not know how kind I could be—if I might. And no one could think anything you did was bold; only frank and beautiful.'

'Why, then,' she asked more quietly, 'did you not come?'

'Because,' he repeated, 'I couldn't. I was on my way to the Picture Gallery, when Aunt

[* Copyright reserved in the United States of America.]

Dawlish came along. I did not wish her to see me, so I slipped into a dark room till she should pass. She didn't pass; she came in and sat down to read. I was behind a window-curtain, and I got through the window into the garden. Then I saw that by the time I had made a fuss to get in at the hall-door it would be too late to find you.'

'I waited a long while,' said she, 'till I was ashamed. And then a horrid idiotic laugh rang through the Gallery, and I was afraid, and ran away.'

'A laugh?' exclaimed Ferrers. 'Was there any one there?'

'No; and I never heard that the Gallery was haunted. Did you?'

'No,' he answered. 'But how sorry, how very sorry I am that I was the cause of your trouble and fright.'

Indeed, as he looked at her and wondered if that beautiful and delicate creature really cared for him, knowing he was not her cousin, and was not ashamed thus simply to confess it, he was wildly elated, and the next moment, as he thought of his own unworthiness, he felt humbled and chastened. And still, as he looked at her, a doubt invaded him, too, of Sir William's truthfulness, and a suspicion that it was impossible Dolly should guess he was other than William Dawlish. If she did, could she be so frank and unconstrained with him?

Meanwhile, Sir William had appeared. He sauntered down towards them, dipping his nose here and there to sniff at a flower, and when he was up with them he slipped his hand into Ferrers' arm. 'One moment,' said he, and drew him aside. 'You asked me last night,' he went on in a low voice, 'where the Picture Gallery is: you wanted, I think you said, to show Mrs Drew the pictures?'

'I did say so,' answered Ferrers.

'Well, if you come with me now, I'll show you.'

Ferrers turned and begged Dolly to excuse his leaving her.

'Where are you going?' she asked quite simply.

And quite simply he answered, 'To the Picture Gallery; while Sir William first frowned, and then smiled somewhat wryly.'

'Do you think,' said Sir William to Ferrers, in a low voice, when they had set off together, 'that it is necessary or wise to be so much alone with Miss Dawlish?'

'Am I really with her too much?' asked Ferrers.

'Well, on your own confession of this morning,' said Sir William, 'her exclusive company is dangerous; and there is such a thing as leading one's self into temptation.'

'I suppose there is,' said Ferrers. 'I'll try to avoid it.'

'Don't avoid her too much,' said the other, 'and don't seek her out too pointedly; try to find a happy mean.'

'I'll try,' said Ferrers.

And then silence fell between them, and Ferrers seemed interested only in noting the doors and the turnings on the way to the Picture Gallery. It was a long low room, with dark oak floor, and with a low-browed, curtained door at either end.

It was lighted in orthodox fashion by slanting windows in the roof, which were shaded by blinds that had doubtless once been white, but that were now stained and dingy. The pictures were mostly faded portraits, with devices in arms and armour between, and Ferrers regarded them with indifference as Sir William led him round and pointed out this and that person and expatiated on their private and public history. They had not been long thus occupied when the door opened, and in came Dolly with Mrs Drew.

'Mrs Drew,' said Dolly, addressing Ferrers, 'heard you were here, and she thought she would like to go round the Gallery with you. She expects you, since you are an artist, to show her which are the best pictures.'

'I don't know much about portrait-painting, though,' said he, 'nor care much.'

'That doesn't matter,' said Dolly, and straightway began to act as cicerone herself. 'I want to show you, Mrs Drew, one particular portrait, that I admire very much—this one down here.' She led the stout and smiling Mrs Drew down the room by the hand, and drew her up in front of the portrait of a cavalier of King Charles's days. 'Isn't it beautiful?' she demanded.

'Very,' said Mrs Drew, marching nearer for a close perusal. 'The lace about the neck and wrists is wonderful!'

'Oh, that's not what I mean,' said Dolly. 'And to get the effect you must keep farther back.'

'A curious and valuable frame, too, I should think,' said Mrs Drew, as she was withdrawn to a proper position.

'Look at it from here,' said Dolly: 'the face, the expression, and the attitude. Whom do they remind you of?'

'Law! Bless me! Yes!' exclaimed Mrs Drew, considering face, expression, and attitude through her glasses. 'Who is it?'

'Don't you see?' said Dolly with a touch of impatience. Then in a lower tone: 'One of us here.'

'You don't mean yourself, my dear?' timidly queried Mrs Drew. 'But I'm not good at guessing riddles.'

Dolly gave Mrs Drew up, and at once surrendered her secret. 'Cousin Dawlish,' said she.

'To be sure!' exclaimed Mrs Drew aloud. 'It is indeed remarkably like Mr Dawlish.—Don't you think so, Sir William?'

'Er—yes,' said Sir William, considering the portrait again. 'I have observed it. There is a considerable likeness, especially in that cavalier way of wearing the moustache.'

'And the lofty look,' said Mrs Drew.

'The nose in the portrait, though,' pursued Sir William, 'is higher and finer.'

'I wonder if there really is a likeness?' said Ferrers, scarce knowing what to say in his embarrassment, or where to look in his bewilderment.

'He was a great soldier,' said Dolly; while Sir William turned to look at her. He manifestly thought there might be something to beware of in Dolly.

'It is very strange,' said Ferrers to himself. 'If Dolly really and truly knows that I am not "Cousin Dawlish," how can she keep up the

pretence that I am so easily and naturally? And especially, why does she keep it up with me?"

Yes; why did she not let him know that she understood the position? Was it because she, like himself, had her feelings so far engaged that she shrank from precipitating an explanation which might end their intercourse entirely, or at least strip it of its curious charm of half-disguise? He hugged that possibility warm to his heart; but yet—yet—while he feared an explanation, he felt it must come, and he must urge it, urge it at the first opportunity.

As they left the Gallery, Dolly reminded Ferrers of his promise to teach her something of the art of painting, and Sir William jocularly proposed that they should all go sketching with pencils, crayons, paints, or what not ('Make quite a sketching match of it,' said he), and in the evening put the sketches to the vote of the company as to which was best of any given scene. When they left the Gallery he carried his proposal round. It was well received; for there was little to occupy the guests—there was no shooting or fishing, and it was too hot to ride—and this was thought a fresh and amusing pastime. While the members of the party were seeking out sketching materials, most being content with pencils and sheets of paper, a large wagonette was being got ready to carry them to a favourite sketching-ground.

'Isn't this abominable?' said Dolly aside to Ferrers when they met with their serious and workman-like canvases and paint-boxes.

'It is,' said Ferrers.

Lord Debrett, who had a soldier's rude eye for a practical joke, appeared furnished with a smooth piece of board and a large carpenter's pencil. 'I think,' said he, 'this is about my size;' and even Dolly was compelled to laugh.

So they set out, carrying luncheon with them; and all—Dolly included, in spite of her preliminary disgust—had a merry day till the sun began to decline, and they returned to Dawlish Place in ample time to dress for an early dinner.

In similar wise did the next day pass—with a picnicking expedition in the morning and lawn-tennis in the early evening—and the next. On the day thereafter Drew had to pay a flying visit to London: the bank, he declared, could not continue its operations wanting both its managers for a whole week; but he was scarcely missed, and Sir William still exerted himself to manœuvre the party and its amusements and occupations. Ferrers let himself be moved this way and that with the others; but he felt somehow that Sir William's management was at work to keep him apart from Dolly, and he thought he understood the reason.

'This is Thursday,' said she on that day, aside to him, 'and we all go back on Saturday.'

'Yes,' said Ferrers. 'I hope we shall be alone this afternoon: I must have a word with you—please.'

But that hope, too, was frustrated: Drumly insisted on carrying him off to see a new reaping-machine at work some miles off. In the drawing-room, after dinner, there was as little opportunity of private conference between him and Dolly as ever, and she after a while in despair departed to her room. Then, as was usual at that time of

night, the men went to the billiard-room, and Ferrers went among them. It was duller even there than usual, for Debrett had gone to town. So, as on the first night, he soon left the billiard-room, being sad and restless, and with his hands in his pockets, marched off with the intention of going to bed. But in the corridor he remembered his first night's adventure, and he thought, 'Why not go to the Picture Gallery on the off-chance of meeting Dolly?' He set off down the corridor; but he was turned back, as on the first night, by the vision of a candle borne aloft by a woman, and that woman Aunt Dawlish! As on the first night, he retreated before her, and, as then, withdrew into the dark room close at hand, with the thought of going right out, as before, into the garden. When he got behind the curtain, however, he found that the shutters of the window were closed! He was fairly trapped now! He must wait till Aunt Dawlish chose to release him!

But, on peeping through the curtain, he became interested in Aunt Dawlish's behaviour. She had left the door open, and had seated herself at the table with her candle and without a book. She sat with her hands in her lap, and she frequently sighed and shook her head. What grief oppressed her, he wondered, while he almost feared to breathe and longed to cough. The minutes passed in slow silence, and still she sat waiting, with her eyes on the open door. Perhaps a quarter of an hour had passed—though to Ferrers it appeared at least an hour—when a step sounded in the corridor, and Miss Dawlish sat up. The step sounded nearer and nearer, and at length Sir William's figure was seen in the doorway.

'What, in Heaven's name!' he said, 'are you sitting there for, Louisa?'

'I want to talk to you, William,' she answered, unclasping her hands. 'Come in and sit down.'

Sir William came in and shut the door, but he did not sit down.

'This dreadful, risky business you're engaged on, William,' said Aunt Dawlish—'is there no other way?'

'Can you suggest another way?'

'No, William, I can't,' said she.

'Then you'd better let my way have its chance,' and he turned to go. 'Especially,' he added, 'since it is almost come to its end.'

'But, William, just listen. I cannot, cannot see how this man's appearing in Will's place is going to help your purpose. How is it going to end?'

'You are very dull and frightened, Louisa,' said Sir William, sitting down. 'I have never denied there are risks about it; but what are they to the risks on the other side? This is the 26th; and if I cannot pay off the mortgage, or give good guarantee of payment by-and-by, Boughton will foreclose on the 31st.'

'So soon as that?' she exclaimed.

'So soon as that,' said he. 'And Dawlish Place and Dawlish estate will be lost; and I shall be ruined so completely that I shall not even be able to pay you your allowance, Louisa!'

'Oh, dear me! Is it so bad as that?' And Aunt Dawlish wrung her hands.

'I cannot pay off the mortgage, as you know;

and the only chance I see of a good guarantee is that this marriage between Will and Dolly shall be agreed upon at once, and proper settlements drawn up.'

(Ferrers in his retirement felt a swift pang of loss and resentment.)

'I know that, William.'

'And you know, too, Louisa,' continued Sir William, growing fiercer and louder as he proceeded, 'that those two old fools, Dolly's trustees, would never agree to her marriage with Will as they knew him some years ago, or even as he is now.'

"Even as he is now!" Just so, William. And do you mean to keep up this young man's imposture till Will is well enough to take his own place?

(Ferrers winced at the word 'imposture'.)

'No, I don't; though the doctors say Will should be well enough to appear all right within a month. I mean to keep this man only till the marriage is agreed upon between me and these confounded trustees, and till a settlement is drawn up. And that must come off to-morrow, or on Saturday: that's what Drew has gone to town about to-day. You see how the old fools—especially that baboon Drummy—are infatuated about the big, healthy brute, and they'll agree quite promptly. The blind old idiots! As if a Dawlish ever looked, or ever could look, like that!'

'The young man is very handsome and clever, William,' said Miss Dawlish.

'Ah,' snapped Sir William (and Ferrers imagined the grin on his face), 'you're like the rest of the women! A good-looking face and a big strong body—and you fall down and worship the man.'

'Just so, William,' retorted his sister. 'That's the danger.'

'What's the danger?'

'You seem not to have considered what Dolly might think in all this. I'm afraid that Dolly is seriously smitten with the man.'

'Oh, pooh! Stuff and nonsense! Dolly is taken with him because she believes him her cousin. But she has the pride of the Dawlishes about her. Once she knows that he is only a rough common trooper, rubbed up a little with knowing people better than himself, she'll be disgusted with herself for having thought anything of him.'

'I wish she may. But she's a romantic girl, and to know he's a poor man may only make her more interested in him. I wish you understood women better, William.'

'I wish I did,' said Sir William. 'But Dolly—you're mistaken in Dolly. She's a sensible girl; she has her father's business faculty, and she knows what's due to her. Besides, she has our interest at heart, and she's attracted to this man, as I have said, because she thinks him her cousin, and she was fond of her cousin when they were together as boy and girl.'

'And I kept her fond of him, William, by talking always about him. That's why I'm afraid now of this man's influence.'

'That'll be all right, Louisa. I'll tell her the whole thing, when the business has been settled with these trustees. I'll appeal to her proper feelings to save the house and our name. She'll

meet Will again when he is quite himself, and we'll get the marriage over before she has time to think, and without these cursed trustees seeing Will at all, except perhaps on the wedding morning in a dark church.'

'I wish it may turn out as easily as you say,' sighed Miss Dawlish.

'Well, now let's go to bed,' said Sir William.

So Miss Dawlish rose with her candle and went out, and Sir William followed her.

THE OLD IMPERIAL YARD MEASURE.

THE discovery, in the month of July last, in the Journal Office of the House of Commons, of the old Imperial Standard Yard and other measures, has given prominence to the fact that one of the least known, and probably the most curious, of all the duties of the Clerk of the House of Commons is that of safeguarding the weights and measures, which formed the subject of inquiry by several Committees of the House of Commons, and by a Royal Commission during the later half of the last, and the first quarter of the present, century. This duty was first imposed upon the Clerk of the House by an order of the Commons 'that the boxes containing the standards . . . be locked up by the Clerk of this House and kept by him.' This order, according to the Commons' Journal, was made on the 2d of June 1758, and was renewed on the 12th of April 1759, and the 21st of May 1760, and has never been rescinded. In the Act 5 Geo. IV. c. 74, declaring 'the standards in the custody of the Clerk of the House of Commons' to be 'the only original and genuine standards from which all other Imperial weights and measures are to be derived,' no provision was made for removing the standards out of the custody of the Clerk of the House; and they have accordingly remained in the possession of the holders of that office since the date of the first order of the House before mentioned.

In 1834, when the Houses of Parliament were destroyed by fire, some of the standards—notably the standard troy pound—were lost; while those that were recovered from the ruins were deposited in the Journal Office, where they have remained for over half a century unnoticed. Neither the Speaker nor Mr Palgrave, the present Clerk of the House, was aware of their existence; but the question of the periodical inspection of the standards by the Speaker having arisen, attention was drawn to the old standards, which were found amongst some lumber by Messrs Shelvey and Davie, of the Journal Office, during the removal of the contents of that office to the new wing on the site of the old Law Courts; and they have latterly been the subject of much curious examination and speculation. Amongst other gentlemen who have recently examined the old standards, and displayed much interest in their history, may be mentioned Mr Peel, the Speaker; and Mr Edward Ponsonby, his secretary; Mr Chaney, the Superintendent of Weights and Measures; Mr Bull, the Clerk of the Journals; and Mr Palgrave, who has since had them removed from the Journal Office to his library, where they will in future be exhibited amongst

the other curios and relics of the old House of Commons.

But besides these gentlemen, the history of the yard standards, of which there were four discovered in the Journal Office, will prove to many of considerable interest. The oldest standard on record was that of the Saxon kings, which was kept at Winchester, and which King Edgar decreed, 'with the consent of his wites or council,' should be the standard. Another old standard, indeed the oldest now existing, dates from the reign of Henry VII., but this has long been disused; and that which, till the year 1824, was considered as the legal standard was a brass rod of the breadth and thickness of half an inch, placed in the Exchequer in the time of Elizabeth. Mr H. W. Chisholm, the late Warden of the Standards, in his interesting work on Weighing and Measuring, says, in reference to these standards, that 'the existing imperial yard is so nearly identical in length that it exceeds them by a little more than a hundredth part of an inch, a difference frequently found in footrules now commonly used. There can also be but little doubt that our imperial yard is substantially the same length as the old Saxon yard. We have no further direct trace to its origin. But the English yard is so nearly the same length as double the natural cubit of the Egyptians and Hebrews; and the English foot is so nearly identical with the ancient foot, two-thirds of this cubit, that the origin of these two English units of length may not improbably be traced to these two earliest standard units. We know that the double cubit was used in ancient times as a measure of length. An old Egyptian double royal cubit, found in the ruins of Karnac, may be seen in the British Museum. We know also that a measure very nearly equal to two natural cubits was used by the Romans under the name of *ulna*, or ell. The *ulna* is mentioned by Pliny, when describing the measurement of the girth of a tree, as half the length of the extended arms of a man. It may thus be fairly assumed that the measure of the double natural cubit, or three feet, under the name of ell or yard, came into use in old times as a very convenient measuring unit, and found its way into England as the standard unit of length.'

But although the difference in length between the oldest standards and the present imperial yard was so small as to be unworthy of notice in measuring a yard of ribbon or calico, the standard of Elizabeth appears, from the following extract from the Report on the new standard scale of the Royal Astronomical Society, to have been incapable of affording any definite or correct measure for great geodetical operations: 'I have had an opportunity of seeing this curious instrument, of which it is impossible at the present day to speak too much in derision or contempt. A common kitchen poker, filed at the ends in the rudest manner by the most bungling workman, would make as good a standard. It has been broken asunder, and the two pieces been dovetailed together, but so badly, that the joint is nearly as loose as that of a pair of tongs, and yet till within the last ten years, to the disgrace of this country, copies of this measure have been circulated all over Europe and America, with

a parchment document accompanying them, certifying that they are true copies of the English standard.'

No reliance could therefore be placed on such a measure for any scientific purpose whatever; but it was not until the year 1742 that some Fellows of the Royal Society and members of the Academy of Sciences at Paris 'proposed to have accurate standards of the measures and weights of both nations made and carefully examined, in order that means might be provided of comparing the results of scientific experiments in England and France.'

A Committee of inquiry was appointed; and it is probably due to the researches of this Committee that Bird's standard of 1760, now in the library of the Clerk of the House of Commons, was adopted as the imperial standard, and declared to be 'the unit or only standard measure of extension.' In the course of their inquiry other standards were discovered besides the legal standard in the Exchequer, 'which were considered of good if not equal authority.' At Guildhall they found two standards of long measure, which were only two beds or matrices, one of a yard, and the other of an ell, cut out of the sides of a substantial brass bar, like that at the Exchequer. Another, preserved in the Tower of London, was a solid brass rod, about seven-tenths of an inch square, and forty-one inches long; on one side of which was the measure of a yard, divided into inches. Another, belonging to the Clockmakers' Company, delivered to that corporation by indenture from the Exchequer in 1671, was a brass rod of eight sides, nearly half an inch thick, on which the length of the yard was expressed by the distance between two upright pins, or small checks, filed away to the proper quantity.

The Committee selected the standard in the Tower, as being the best defined, and consequently the best adapted to their purpose; and Mr George Graham—a celebrated clockmaker—at their desire, laid off from it, with great care, the length of the yard on two brass rods, which were then sent to the Academy of Sciences at Paris, who in like manner set off thereon the measure of the Paris half-toise. One of these was kept at Paris; the other was returned to the Royal Society. From the copy made by Mr George Graham for the Royal Society, Bird made his standard of 1758; and from this the standard of 1760 was copied, the latter standard being described, in the Report of the House of Commons Committee—upon which Report the Act passed in June 1824 is based—as 'best agreeing with the most extensive comparisons which have been hitherto executed by various observers and circulated throughout Europe, and in particular with the scale employed by Sir George Shuckburgh.'

In 1758, or sixteen years after the Royal Society had initiated the inquiry, a Committee of the House of Commons was appointed to inquire into the original standards of weights and measures in the kingdom. As may be seen from the Journals of the House of Commons, the Committee entered very fully into the subject, and in their Report recommended that 'a rod, which at their order had been made by Mr Bird from that of the Royal Society, and marked

"Standard Yard, 1758," should be declared the legal standard of all measures of length.' This rod—which is one of those now in the custody of the Clerk of the House—consists of a solid brass bar, 1·01 inch square and 39·06 inches long. At about an inch and a half from each end, a gold pin or stud is inserted, in which pins, at the distance of thirty-six inches, are two points intended to designate the length of the yard. As may be seen from a reference to the Journals, it was proposed that this rod should be kept in safe custody in the Exchequer Office; but it was ordered for the time being to remain in the care of the Clerk of the House.

In the following year, another Committee was formed on the subject. It concurred in the recommendations of the former Committee that Bird's standard yard should be the only unit of lineal measure; and at the same time recommended that a copy of it should be made for security against accidents, and deposited in some public office. Accordingly, a second standard was constructed by Bird in 1760 similar to the former, of which, indeed, it was intended to be a copy. The last standard of 1760 was declared by the Act of 1824 to be the legal standard of the kingdom.

But although two Committees of the House of Commons had thus sat and reported upon the subject, no legislative enactment was passed, and the standard measures remained in the custody of the Clerk of the House. In 1814 another Committee was appointed, and made an abortive Report; and five years later, in 1819, a Commission was nominated by the Prince Regent. They reported in favour of the standard which had been made by Bird in 1760; and this Report having been approved by a Committee of the Commons, an Act was passed in June 1824, which for the first time defined the unit of measure, and in the following terms: 'The straight line between the centres of the two points in the gold studs in the brass rod, now in the custody of the Clerk of the House of Commons, whereon the words and figures "Standard Yard, 1760" are engraved, shall be, and the same is hereby declared to be the original and genuine standard of that measure of length or lineal extension called a yard; and that the same straight line or distance between the centres of the said two points in the said gold studs in the said brass rod, the brass being at the temperature of sixty-two degrees of Fahrenheit's thermometer, shall be and is hereby denominated the imperial standard yard, and shall be and is hereby declared to be the unit or only standard measure of extension.'

No mention was made as to the person who should have the custody of the standard yard, and it therefore remained in the care of the Clerk of the House; but provision was made in the Act, in case of the loss, destruction, or defacement of the standard, for the making, under the directions of the Lord of the Treasury, a new standard yard, bearing the proportion to a pendulum vibrating seconds of mean time in the latitude of London, in a vacuum, and at the level of the sea, as 36 inches to 39·1393 inches.

The new standard excited much hostile criticism. It was urged that the standard adopted was not an original measure, but a reproduced

copy of that in the Tower; and when it was compared with a new standard scale made for the Royal Astronomical Society, 'it was found to be utterly impossible to ascertain the centres of the points in the gold studs within distances perfectly appreciable by the methods of observation now practised.' Mr Baily, in his Report above cited, says: 'The mean diameter of each of the holes was nearly one hundredth of an inch, and they by no means presented anything like a circular shape. In fact, not only did different persons differ in their estimate of the centres, but the same persons also differed at different times, according to the degree or direction of the light that impinged on the sides of the holes.' And he adds: 'How the legislature of the present day, when the art of making mathematical instruments has arrived at such a state of perfection, could have sanctioned the adoption of such an imperfect and undefinable measure as this for a standard, must always be a matter of astonishment.'

Mr Chisholm says that 'the comparing apparatus in use at that period consisted of a beam compass with two fine measuring points, which could be adjusted to the dots on the standard measures under comparison. But the result of numerous comparisons of this kind made from time to time, previously to the destruction of the standard in 1834, had been to leave the edges of the holes indented and irregularly worn away, so that the original centre was very difficult to ascertain. Mr Baily, who had made some comparisons with this standard yard in the early part of the year 1834, describes the holes as appearing like the miniature crater of a volcano.'

The new standard had, however, but a brief existence, being destroyed in the fire which consumed the old Houses of Parliament in 1834. Chisholm says: 'The two standard bars of 1758 and 1760 were both found amongst the ruins of the Houses of Parliament; but they were too much injured to indicate the measure of a yard which had been marked upon them; but how they came to be stored in the Journal Office nobody appears to know. By their present appearance the bars seem to have sustained little injury, except that the left-hand gold stud has disappeared from either standard; but whether the injury was caused by the action of the flames or by accident or design is not known. When, however, it is remembered that it was upon the points on the gold studs that their accuracy and precision depended, there can be no doubt as to their value for scientific purposes being hopelessly destroyed.'

After its destruction, a new Commission was appointed in 1843 to reconstruct it; and researches for this purpose, in conformity with the Act, were begun by Mr Francis Baily, and, after his decease in 1844, were continued by the Rev. R. Sheepshanks till his death, the work being completed by Mr G. B. Airy, Astronomer-royal, afterwards Sir G. B. Airy, K.C.B. It was found that the restoration of the old standard could not be effected in the manner provided by the Act with any degree of certainty, as Bird's standard had never been directly compared with the pendulum; and it was also discovered that the relation between them of 36 to 39·1393

assigned in the Act was incorrect, 'on account of the neglect of certain precautions in the determination of the length of the pendulum which subsequent experiments have shown to be indispensable.' The late Warden of the Standards says, in his work above mentioned, that 'in order to select the most perfect specimen for the new standard of length, forty line standard yards were constructed of Baily's metal, and one of these was finally selected as the imperial standard, not only from its representing, with the greatest precision, the assumed length of the lost standard yard, but also from the clearness of its defining lines, and from its general good workmanship. The details of the numerous comparisons of all these new standard measures, including the determination of the rates of expansion of the several bars, may be found in the Astronomer-royal's account, *Philosophical Trans.* 1857, Part 3.' The present standard yard is in the Standards Office; but in case of injury or loss, four copies of it are deposited in other places, one being the House of Commons, where the copy is walled up; but no duty is assigned to the Speaker or the Clerk of the House in connection with it; section 35 of the Weights and Measures Act, 1878, which provides for the care and restoration of the Parliamentary copies of the Imperial Standards, specially exempting this copy from periodical inspection.

ON THE MARSHES OF DEVA.

IN TWO CHAPTERS.—CHAP. I.

'ABRAHAM RICHIE, Farmer.—What a singular title for a canoe!' I reflected as I laid my fowling-piece across the thwarts and leisurely began to fill my briar, scanning meanwhile the letters painted on the stern—'and what a monster of a gun!'

I had seen nothing larger hitherto than an eightbore fowling-piece; and the sight of the six-foot barrel with a muzzle as wide as a half-pint tumbler filled me with astonishment. It was fitted to a stock of like proportions, and of the shape of an ordinary shoulder-gun, and rested in a groove in the bows, reaching almost from end to end of the little craft. Goliath of Gath when upon the war-path would have shouldered just such another weapon, if it had then been invented; but I came to the conclusion that the gun was far too cumbersome to be used to advantage by the average human being.

I found afterwards that for every duck or plover slain by my gun, after hours of patient watching in the dykes of the marsh, Abraham Richie's leviathan would strike down scores with ease. I had the pleasure of trying it in after-days; and on one of these occasions, after the recoil had, as usual, driven the little flat-bottomed vessel several feet backwards, I paddled forward to find no fewer than thirteen widgeon lying dead upon the tide.—But I am anticipating.

The marshes of the Dee estuary are of considerable extent, and off Burton, near Chester, they

cover almost the whole of the three miles of river-bed that divides the Flintshire and Cheshire coasts at this point. They are the night-haunt of the numerous wildfowl that frequent the river; and often during the season had I tramped over from Flint to take up my watch with the wild-fowlers in the hollows which the tides have excavated in the marsh. A fisherman had pointed out a spot where the Deep—a channel by which shipping passes to and from Chester and Connah's Quay—could be safely forded at low water; and equipped with a pair of tall boots, I found that I could reach the marshes on the Cheshire side with but little inconvenience. I had heard many stories of Abraham's wholesale slaughter of wildfowl, while upon my 'flying' expeditions. How Abraham the elder, who now lay in Burton churchyard, had established himself upon the farm now occupied by 'Aba' the younger by fringing the stalls of the Liverpool poulterers with wild-birds; and how the younger strove faithfully to follow in the father's footsteps by engaging in midnight excursions in a little white canoe, whereby the milkcart which rattled out of the farmyard in the early hours of the morning frequently carried an additional burden, and Aba's banking account grew apace.

When I discovered the canoe, I was returning from a bootless expedition, which had used up the greater portion of a Saturday afternoon; but this I did not mind. I was fond of solitude, and the change from the stuffy bank in which I spent my working hours to the prairie-like marshes overrun by the fresh breezes of the Irish Sea, was grateful indeed.

As I concluded my inspection, and was turning to go home, I noticed that the numerous sheep which had been widely scattered over the marsh were closing into large flocks, while a black sheep-dog, which in the distance looked exactly like a flying crow, was darting with great rapidity in the direction of some distant stragglers. At the same moment I became aware of a female figure standing upon the grass-grown embankment, which was pushed out over the marshes in a fruitless and expensive attempt to win some of the broad acres for cultivation. She was watching the motions of the dog, and my route lay directly past the spot where she was standing. I noticed that her appearance was attractive; but as I drew nearer, I felt that such a term would be a very inadequate description of this enchanting nymph of the marshes.

Her sweet girlish face was lighted by wonderful gray eyes, shaded now by a little white hand, as she looked away westward to where the lagards were returning in a huddled despondent little group, while the dog, with tail erect, moved right and left behind his charges, after the manner of a vessel tacking against a head-wind. There was an air of refinement about her not usually found in shepherdesses in real life; and as the rays of the departing god of day streamed up the river and lighted on her graceful figure, they bathed it in an unearthly radiance.

I had many times noticed that the sheep upon the marsh were branded 'A. R.' and on the strength of this fact, I boldly doffed my 'Shanter' and asked 'Miss Richie' if she knew when it would be high-water, and further, whether she

thought I might safely cross to Flint. Our conversation scarcely lasted a moment, however, for directly afterwards a broad-shouldered homespun individual, who was appealed to as father, and who had directed more than one sharp glance at me as he approached, gave me the desired information. When, after more conversation and more searching glances, Abraham invited me to go up to the house and drink a dish of tea with him, I did not refuse.

I found that the other members of the household consisted of Mrs Richie, a very busy lady of matronly aspect; a red-armed servant girl, with lilac-printed gown and wooden pattens, that clacked loudly as she walked; a younger abigail, with red cheeks and beady black eyes; and a middle-aged and melancholy-looking cowman, who glanced surlily up at us as we passed through the yard that led to the side-door of the substantial farmhouse.

The name of the last-mentioned individual was, I afterwards learned, Yethert; and this strange appellation served both as a Christian name and a surname. Why 'Yethert,' or who gave him that name, no one appeared to know. He had strayed into Abraham's service from the harvest-field, nearly seven years previous to my acquaintance with the family, and no one had deemed it necessary to make any very pressing inquiry as to his antecedents. I mentioned his strange taciturnity to Abraham once, and he replied carelessly that his cowman was a 'queer ould sort;' but he was as 'honest as they make them;' adding, with a laugh, 'and he's a real Cheshireman. If you shook him up, you'd hear the beans and buttermilk rattle—and that's a sure sign of a Cheshireman all the world over.'

Tea was served in the well-furnished sitting-room overlooking the river and the fair landscape beyond; and in the hour which followed, I learned much of the ways and wiles of wildfowl; and I found, too, that as an only daughter, Miss Richie had received an education superior to what might have been expected of a young lady in her position. When I left, I carried with me a general invitation to call any time that I was over that way, and a vision that haunted me as I had never been haunted before.

I paid many visits to the marshes after that; but I brought home fewer birds than ever; and my little Welsh landlady, who, on the strength of a long acquaintance, occasionally addressed me in unstudied phraseology, would assume a look of something approaching disgust when she saw me take down the weapon of the chase and begin to fill my belt with cartridges.

'What for do you go out in the night-air, Mr Graham, when you bring nothing back with you but a cold?' she burst out on one occasion. 'But, indeed, you will come back drowned some fine night—mark my words, if you don't. You will, for sure!'

Despite these encouraging predictions, I would sally forth as usual; and later in the evening my breechloader would be resting in the cosy ingle of the house, whose distant light seemed to beckon me like a ray of hope over the wastes that lay between.

So day followed day until a certain eventful Saturday drew near. The following Monday was to witness sheep-washing upon a grand scale on

the marsh; and as I had expressed a desire to witness what was to me a novel sight, Abraham, with characteristic kindness, invited me to spend the Sunday and Monday under his roof. 'You'll have to come round by rail, though, my lad,' he remarked, 'for the spring tides are on; and it wouldn't be safe to cross by the "Cop" [embankment]. Pity the trains run so awkward, for you can't get here till the afternoon. We'll have the dinner an hour later, though; the young fellow who is coming out from Liverpool won't mind.'

I did not relish the idea of 'a young fellow from Liverpool;' but I accepted the invitation.

It so happened that the Saturday evening was an anniversary that always brings me a train of sad reflections, and this was no exception. I laid down my book and wandered out in the dusk through the streets of the little town, and on, and on, to the river. I sat down under the shadow of the crumbling castle wall and looked out over the river banks. The shore was deserted; but ever and anon the distant report of a gun was borne across the silence of the marshes; and in fancy I could see the wildfowls crouching low in the dykes and eagerly watching the patch of gray sky over their heads, as with finger on trigger they waited for a snap-shot at the swift-winged birds who were sweeping up to the marshes for the night. Others, again, were standing erect in the solitude like sentinels, and with their guns at the 'ready' position, were peering steadfastly into the gathering gloom.

While I thus mused, a slim young moon looked calmly down at her reflection in the deep; and miles away, the familiar lights on the Cheshire side began to flicker into existence. I knew them all. There was the solitary light of Abraham's farmstead, gleaming like a diamond in its dusky setting. A little to the left, another diamond point marked the whereabouts of Denhall; and high on the hill above twinkled the village lights of Ness, where little Emy Lyon—Lord Nelson's Lady Hamilton—was born. A little way down the river, again, the lights of the 'forgotten watering-place,' Parkgate, were strung together like a glittering necklace; and far, far beyond, the lights of Liverpool flashed upon the horizon like a mighty conflagration.

Soon the bells of Flint Church began to ring for evening service, and again my thoughts wandered away to certain graves lying, all peaceful enough, beneath the sound of church bells in the north country. Anon, the peals died away; the 'last bell' struck up a shrill brief warning to lagging worshippers; and in the silence that followed, the whistling cries of the wildfowl could again be heard.

The firing had now ceased; the 'flighting' was over for the night, and the wildfowls would now, I knew, be toiling homewards over the broad stretches of sand. I rose at last, stiff with the long sitting, and was turning away from the beach, when I heard other footsteps grating upon the shingle and gradually approaching me. I paused, and idly watched a human figure grow out of the dim light, fifty yards away. The moon was obscured at the moment; and with some difficulty I made out the form of a man with a broad-brimmed hat and somewhat slouching gait. Presently I saw him stop and stoop low, so as to

bring the outline of my body against the sky. In a moment he hailed me.

'Well, Mester Graham, an' is it yew! Why, I've bin lookin' fur ye all over Flint. All over Flint, that I have; an' here you've bin all the time.'

I recognised the voice at once. It was Yethert, and in another moment that once surly individual stood before me. But what a change had come over the man! The battered felt hat; the patched velveteen coat with capacious pockets; the corduroy breeches, encircled, for some inexplicable reason, with a piece of string under each knee; and the heavy navigator boots, still decorated the square-set figure; but for all these familiar embellishments the man was transformed. The Yethert of the Richie farmstead was black-browed, and so sparing of speech that I never knew him utter a word unless in reply to a direct question; but the Yethert who now addressed me was quick-spoken, eager, and all but brisk in his manner. The Yethert I had known heaved in his gait as if he was firmly attached to the tail of an invisible plough; but Yethert as he walked on the Flint beach was a military-looking person in comparison.

He continued: 'I've bin to yer house, and the Missis didna know wheer ye'd gone. Ye hadna gone after the ducks, she said, fur yer gun was hangin' up wheer ye left it.—But, mester!—he broke in with a peculiar laugh, that sounded strangely there on the lonely shore—'ye can go after the ducks without a gun, canna ye? I know all about it; and again he laughed aloud.

I was more and more astonished. To have met with Yethert in Flint at all was surprising; but to have him discourse in this free-and-easy manner, and above all, to find that he could evoke a laugh, was a most unheard-of thing. I could only conclude that his altered manner was due to sundry visits to the local public-houses; and ignoring his last remark, I asked him what had brought him over to Flint.

'Well,' he replied in a confidential manner, and slightly lowering his voice, 'ye see th' Mester and th' Missis has bin talkin' about ye; and they reckon it's a pity that ye shouldna get over till the Sunday afternoon; and so they tould me to mexan up the cows as quick as I could and walk over and fetch ye.'

'But what about the tide?' I interposed. 'The tide will be running in soon, and we may be caught by it if we attempt to cross.' (I may here remark that in common with many other persons who live in the immediate vicinity of the beach, I never know exactly when it is high-water, or when the tide begins to ebb or flow, excepting when I happen to see it.)

From the window of my study where I am writing these lines I can see the advancing tide streaking the yellow sands with bars of silver. I see it thus day by day, and I know its varying moods as I know the peculiarities of an old friend. I have watched the Storm King a thousand times as he has girdled himself in the distant hills and stalked on legs of vapour over the estuary; and yet, if I am asked a few hours afterwards what time the tide will begin to roll in, I am obliged to make the humiliating confession that I do not know.

Yethert laid his hand impressively upon my

shoulder as he made answer: 'Mester, I know every inch a land in the river, and I can get ye to th' Cop afore the tide comes in as easy as winkin'. When ould Yethert does a job,' he added fervently, 'he does it gradely [properly]; and th' Master and Missis wouldna ha' sent me over to ye if it wasna reet. Besides, Mester, do ye think ould Yethert wants to slip his wind? Nay, nay! Come on afore it's too late.'

Yethert's knowledge of the banks and of the spots first covered by the tide was, I knew, perfect; and after a little hesitation, I returned with him to my apartments, obtained possession of a small travelling bag, and returning to the shore, we waded cautiously over the Deep, and stepped on to the firm sandbank beyond.

No sooner had we reached the opposite side, however, than Yethert's eagerness departed, and his habitual gloom of manner returned. He sauntered along in the old heaving churlish fashion, sometimes labouring by my side, sometimes walking a little in advance, and more often lagging in the rear. Finding that I could no longer draw a word from him, I strode steadily on in the semi-darkness, my eyes ever fixed on a tiny light far ahead, and my mind busy, among other matters, with the mysterious 'young fellow' whom I was to see on the morrow, and of whose personality or relationship to the Richie family I was as yet quite ignorant.

We reached the marsh, and I was soon fully engaged in leaping or eluding the network of dykes and the tiny lakelets that continually barred my progress. Yethert leaped the smaller obstacles with much greater agility than might have been expected from his appearance, and waded through the broader pools, as I had often seen him at Burton, without removing his boots, and with the utmost unconcern. He had fallen behind considerably, and apparently was not over-anxious to get upon even terms with me, for whenever I heard the peculiar sucking noise made by his saturated boots, they always sounded a long way in the rear.

This did not surprise me. My greatest surprise had been the extraordinary affability Yethert had displayed towards me in the earlier portion of the evening, and the unusual eagerness of his manner. I several times fancied that the water in the dykes was rising; but my confidence in Yethert's superior knowledge of the banks and tides was such that I apprehended no danger, and the Cop—a sure refuge from the tides—was beginning to show itself like a dark shadow across the marsh. Separating the Cop from the marsh is a broad shallow stream, which, before it begins to be fed by the tide, is seldom more than two feet deep; and when I thought about the matter at all, my only feeling of uneasiness was, that before we reached it, it might have risen to such a height as to cause us to wade to an inconvenient depth.

The moon hung over the Halkin Mountains at our backs, a woe-begone half circle of pale gold; but the stars shone out with great brilliance, and the Cop was beginning to define itself more and more clearly against the horizon. I could even faintly distinguish the rude shed on its summit, in which Abraham's shepherd boy occasionally stood sentry over his woolly charges on the plain below; and I was congratulating

myself on my near approach to the comforts of Abraham's well-stocked larder, when I was brought to a sudden stand-still by the appearance of a number of glittering objects on the marsh some distance in front of me, which wavered and flickered about in the most extraordinary manner. I could not make it out, and I walked on again towards the spot. A few strides explained the mystery. On the marsh in front of me was a vivid reflection of the starry canopy above; and as I stood rooted to the spot, with my heart thumping against my ribs, I could hear the measured rhythmic ripple of the advancing plain of water that had intruded itself between me and safety.

THEATRICAL 'BENEFITS.'

AMONG the many changes that have taken place in theatrical customs and arrangements during the last thirty or forty years, none is more marked than the decline of the old system of allowing the principal performers each season to supplement their salaries by the proceeds of Benefit performances. Actors and actresses of any mark now obtain much higher salaries than in former times, and Benefits are practically restricted to charitable objects. The reform is wholesome and was much needed. The evils of the old system reached a climax in the case of impecunious provincial or travelling companies.

The degrading begging—'canvassing,' Mr Crummles called it—by means of which benefit tickets were disposed of by poor Nicholas Nickleby and his fellow-actors in the famous Crummles' Company will readily recur to the reader's memory. Benefits with them were 'bespeaks,' and were taken at every possible opportunity. The frequency of these calls on the sympathies of theatre-goers led to embarrassments, for when Miss Snevellicci wished to take a benefit, the difficulty was to find a new excuse. 'She had a bespeak,' said Mr Crummles, 'when her mother-in-law died, and a bespeak when her uncle died; and Mrs Crummles and myself have had bespeaks on the anniversary of the Phenomenon's birthday, and our wedding-day, and occasions of that description; so that, in fact, there's some difficulty in getting a good one.' Accordingly, Nicholas, recognising the difficulty of providing a constant succession of defunct relations or interesting family anniversaries, did his best to help the fair Snevellicci. At York, it was of old the custom—suppressed by Tate Wilkinson towards the end of the last century—for the actors to solicit patronage for their benefits with a bill of the performance in their hands, which they readily exchanged for the usual fee of half-a-crown. Wilkinson records that at one of his own benefits at Maidstone his gains amounted to two pieces of candle and eighteenpence in cash.

Actors' benefits owe their origin to King James II., who ordered the first performance of this nature to be given for Mrs Elizabeth Barry. This lady found benefits so profitable, and such an admirable means of augmenting a scanty salary, that the practice soon became general. One of the most famous of these early benefits was that given to the veteran Betterton on April

6, 1709. The house was unusually full of persons of distinction, and the stage itself was crowded with ladies and gentlemen, who paid handsomely for the privilege of occupying this point of vantage. Pit tickets were paid for at the rate of a guinea apiece, a sum equivalent to a considerably higher charge nowadays. The play was *Love for Love*, and Betterton was supported by two famous actresses, Mrs Barry and Mrs Bracegirdle; but the movements of the players must have been greatly impeded by the presence of so large a part of the audience on the stage. In April of the following year, Betterton took another and last benefit, in which he made his final appearance on the stage. For fifty years he had been the leading actor in both comedy and tragedy, and on this last night he won enthusiastic applause as Melantius in *The Maid's Tragedy*. The sham was very quickly followed by real tragedy, for the veteran actor died within forty-eight hours of the end of the play.

The inconvenient and absurd custom of allowing spectators on the stage was finally suppressed many years later by Garrick. The change was resisted at first by the actors, for the high charges made for stage seats had always materially helped to swell their gains on benefit nights. Garrick met this by enlarging the house, and so providing more seats for the audience in front of the curtain. The old system led to many absurd spectacles. Quin, when playing Falstaff for a brother actor's benefit, had literally to force his way to the front of the stage through the crowd of spectators assembled thereon; and Juliet, when supposed to be lying in solitary state in the tomb of the Capulets, lay surrounded by scores of onlookers.

The old custom of allotting certain nights' performances for the benefit of the author of a play, which had been in vogue long before actors' benefits were first instituted, was still maintained. When Rowe's *Jane Shore* was produced in February 1714, the third, sixth, and tenth nights were set apart for the author's benefit; and on the first two of these nights we are told that the boxes and pit were laid together and half a guinea was made the price of admission; on the third night the performance was given 'at common prices.' *Jane Shore* was a great success, and Rowe no doubt obtained no inconsiderable pecuniary gain from his three benefit nights.

Miss Rafter—afterwards famous as Kitty Clive—made her first appearance on the stage at a benefit taken in 1730 by Henry Carey, the author of many once famous farces, and still remembered as the poet of *Sally in our Alley*. The evening's proceedings on this occasion were remarkable, and certainly unusual. They embraced, in addition to the performance of a cantata by Carey, a march in procession of musicians, armed, according to a contemporary chronicle, with all the instruments invented since Tubal Cain, from the Haymarket to Temple Bar, where they were joined by 'authors and printers' devils,' and thence, with the addition of painters at Covent Garden, to Drury Lane.

The first benefit for the Drury Lane Theatrical Fund 'for the relief of those who, from infirmities, shall be obliged to retire from the stage,' was given at Drury Lane in 1761, when Garrick

played Kately in Ben Jonson's *Every Man in his Humour*. Fifteen years later, on June 10, 1776, Garrick took his farewell of the stage, playing, for the benefit of the same Fund, the part of Don Felix in *The Wonder*.

The benefit performances of the last century were given not only for actors, authors, and charitable institutions, but for a great variety of miscellaneous objects. In 1715 the last performance of the season at the theatre in Lincoln's Inn Fields was given for the benefit of 'Tim Buck, to release him out of prison.' Four years later at the same theatre the play was announced by one Spiller as 'for the benefit of himself and creditors.' One man took a benefit because, he said, 'my friends having expressed a great dislike to my being on the stage, I have resolved upon taking this benefit to enable me to return to my former employment.' The rascal pocketed the proceeds of the performance, and remained on the stage. More praiseworthy than some of these were the occasional nights given in aid of hospitals, church building, sufferers from fire, and other charitable objects. The monument to Shakespeare in Westminster Abbey was erected in 1741 out of the proceeds of benefit performances given at Covent Garden and Drury Lane.

Many remarkable performances for the benefit of individuals have taken place during the present century. A curious medley was given at Drury Lane on June 12, 1820, for the benefit of Edmund Kean. Kean sang songs, accompanying himself at the piano, and gave imitations of Kemble as Hamlet, of Inledon and Braham, with a song in the manner of each, and of Munden, Lamb's favourite comedian. The versatile actor also danced, and gave an exhibition of fencing. The evening's entertainment was preceded by a prologue that grossly flattered the famous tragedian; it concluded with the lines:

Who can act the Admirable Crichton on the scene?
The answer's plain, the Admirable Kean.

'Autres temps, autres mœurs,' it is difficult to imagine Mr Irving figuring as the hero of such a 'variety entertainment' as on this occasion served for Edmund Kean's benefit.

Noteworthy performances of Ben Jonson's *Every Man in his Humour* were given by Dickens and his famous company of amateurs at Liverpool and Manchester in 1847 for the benefit of Leigh Hunt. The company included John Forster, Douglas Jerrold, Mark Lemon, John Leech, and other celebrities; while Talfourd and Bulwer Lytton supplied addresses eulogistic of Hunt. When Dickens and his company first acted this play in 1845 at Miss Kelly's little theatre in Dean Street, the performance was greatly applauded; but a second representation on the larger stage of the St James's Theatre was not so successful. The audience was very fashionable and distinguished, but withal somewhat cold. Before the play began, Lord Melbourne remarked, not very critically, that it was a dull play; and between the acts his lordship declared in a loud voice from his box: 'I knew this play would be dull; but that it would be so confoundedly dull as this I did not suppose!'

Of late years, benefits have been occasionally given to particular actors or actresses as testi-

monies of the esteem in which they are held by the other members of their profession. The bill of the performance given for the benefit of Charles Mathews at Covent Garden on January 4, 1870, before he started for Australia, contains a remarkable list of names. It includes those of Buckstone, Barry Sullivan, Toole, Brough, Webster, the Bancrofts, H. J. Byron, J. S. Clarke, Mrs Keeley, Mrs Chippendale, Mrs Alfred Mellon, and many other theatrical celebrities.

Some of these latter-day benefits have realised very large sums of money. One given to Lester Wallack at New York in 1888, shortly before his death, produced four thousand five hundred pounds, the whole of which was generously given by the beneficiary to a charitable institution associated with the stage. The famous Compton benefit, given at Drury Lane in March 1877, together with a performance at Manchester, where Compton had long been a favourite actor, realised the imposing total of five thousand pounds. An extraordinary number of well-known performers took part in this Drury Lane benefit. The names of Creswick, H. Wigan, C. Warner, Hare, Kendal, Webster, David James, Farren, Henry Irving, Jefferson, Phelps, Charles Mathews, and of Miss Ellen Terry, Miss Ada Cavendish, Mrs Chippendale, and Mrs Kendal, represent but a few of the dozens of well-known actors and actresses who shared in this tribute to the veteran comedian.

WILD WILL.

A WESTERN STORY.

NOT to have seen and known Custer City would, so recently as six years ago, have been looked upon as a serious defect in a Western man's education. Never to have met Wild Will would at once have stamped one as a 'Tenderfoot.'

Wild Will, first. His real name was J. B. Hickock; but this had long been forgotten, and his famous sobriquet stuck to him more closely than his shirt. His reputation as the greatest scout in the West was spread far and wide; but Western scouts, like the majority of mountain guides, do not amount to much. They are great in the personal reminiscence way, and can drink deeply with impunity, or with any one who invites them; but in other respects they are generally of the class described as frauds. Wild Will, however, was one of the few whose deeds overshadow their words. His supreme courage and physical strength had endeared him to the rough miners and cowboys, who regarded him as a hero, and rendered his name a word of terror to every red-man west of the great Missouri.

Custer City lies in the Deadwood region of the famous Black Hills, and is pleasantly situated in an open park, hemmed in on all sides by gradually rising hills, rock-ribbed, and crested with dark towering pines. At the time of which I write the streets were regularly laid out; and the buildings, chiefly constructed of logs or rough boards taken from the hill-side forests, might be

roughly estimated at about one thousand in number. It looked like a promise of good things to come; but the greater attractions of Deadwood nipped it in the bud, and, from a mining town, Custer sank into a centre for supplies.

Life in the wild Black Hills is more real and earnest than is stagnation in the schools and banks of the old country, as many a former 'varsity man, or sometime dapper clerk, has discovered; while its wholesome sternness somewhat compensates for its not infrequent brevity. Even parsons are apt to develop 'clear grit' in the bracing atmosphere of the Hills. A clerical friend of the writer's cheerfully pursues his duty in Lead City, Dakota, notwithstanding that his immediate predecessor was shot dead in the street by a drunken Indian, and that he himself weekly finds 'drink-checks' and cartridges figuring in the collection plate. This last eccentricity is only the way of the boys, who do not hesitate to play practical jokes upon the man for whom they would die, so gentle is he with the victims of the 'accidents' which are constantly occurring in a mining camp.

The god of Custer was Whisky, and his temples in the shape of saloons were in every street. The principal one of these was kept by High-priest Moriarty, an Irishman, red-headed, red-armed, and red-hot. The crowd had assembled at Moriarty's after mining hours in order to drink and see the fun. There was a scuffle in the large bar-room. A slightly-built young lad, of not more than eighteen or twenty years of age, was seen struggling in the vice-like grasp of a muscular, brutal-looking miner of twice his age. It was plainly only a question of minutes when the burly ruffian would crush his youthful opponent. But before the older man could free himself from his delicate-looking but agile antagonist, the youngster got in a nasty blow, drawing streams of blood from his opponent's face. The throng laughed at this. Stung by the sound of mockery, the irritated recipient, quick as lightning, drew a pistol from his belt and levelled it. The lad's fate seemed certain. At this moment some one stepped swiftly through the half-open door, laid his hand upon the brawny desperado's shoulder, and, without apparent effort, sent him reeling to the farther end of the bar.

'Wild Will!' The words ran in whispered admiration round the room. The miners clustered more closely together; the more timid, or, possibly, more prudent, of Moriarty's customers withdrew. There was certain to be some free shooting after what had occurred, and both parties were reputed handy with their shooting-irons.

The new-comer stood some six feet two inches in height, and was exceedingly powerfully built. His face was open and highly intelligent; his flaxen hair fell in long thick ringlets upon his broad shoulders; his eyes, blue and laughing in expression, looked one straight in the face while he spoke; and his thin, closely-compressed lips were partly covered by a heavy blonde moustache. He seemed such a one as women and children would instinctively cling to in the moment of danger. This hero, who appeared strangely out of place in a Western bar-room,

wore a costume which was a curious combination of the attire of a prairie ranger with that of a fashionable dandy. From underneath the skirts of his elaborately embroidered buckskin coat gleamed the butts of a pair of silver-mounted revolvers, which were his inseparable companions.

The bully speedily recovered himself. Staggering to his feet, he darted back towards his assailant, only to recoil with dismay from the dark muzzle of a revolver, and the calm mischievous eye which gleamed coldly and cruelly behind it. 'Drop that shootin' iron at once, sirree.'

The pistol fell with a crash upon the floor.

'Curse you, Will!' growled the fellow, as his hand moved stealthily towards his belt. 'What do you interfere for? 'Tisn't no business o' yourn.'

'Hands up, Jack—sharp! or I shoot.'

'Will means business.'

'I say, mate, that lad's in luck.'

'Send I may die, but I wouldn't stand in old Colorado Jack's shoes for nary red cent.'

Such were some of the remarks which the miners addressed one to another.

Clearly Wild Will was a prime favourite in Custer City.

The quarrelsome ruffian, who had been called 'Colorado Jack,' felt this, and knew that he stood practically friendless and alone in the crowd. He shifted uneasily, first on one leg, then on the other, and at length managed to bluster out: 'It isn't the first time, you hound, that you've spiled my game; but it's got to be the last. One of us shall be wiped out, and I don't much care which.'

'Be it so,' said Wild Will, with the faintest possible flush suffusing his fair face.—'You hear him, gentlemen. I accept the challenge.'

'Then we'll settle this little business here and now.'

'No, but you don't!' thundered Moriarty, snatching up a Winchester repeating rifle. 'I'll have no bloodshed in my place.—Go outside, and do what you like; but you shan't bring the Sheriff or the Vigilance here; so I tell you plain, Jack.'

'Hold!' The word rang out like a bugle-note. It was Wild Will who had spoken. He continued, firmly and coldly: 'As I am the challenged person, it is my right to select both place of meeting and weapons. There is no need for further interruption of the evening's amusement.—Colonel Coldey, you will act for me.—Moriarty, I stand drinks round.'

'Hurrah! for Wild Will, the bravest scout, and the dashingest Injin fighter in the hills!'

So the company shouted as they clustered around the bar and prepared to drink at their threatened hero's expense.

This openly evinced partisanship was more than Colorado Jack could endure, so he scowlingly withdrew from those who no longer desired his presence. As the meanest of living things would seem to have some parasite, so it was with him. He was followed by a low-browed, bandy-legged, villainous-looking Mexican, who was known in Custer City by the name of 'Chuck-halter.' The fellow had acquired this name from his having once narrowly escaped hanging for

the unpardonable crime of horse-stealing, at the hands of justly incensed Arizona cowboys.

When the two worthies had got well out of sight of Moriarty's, Jack turned round to his follower, and inquired: 'Well, Chuckhalter, what have you got to say?'

'You should have wiped him out,' answered the Mexican. 'I would have given a hundred *onzas* to have seen it done.'

'Ah! I remember, mate, you've felt the weight o' the skunk's hand too. 'Tain't a light un.'

The Mexican twisted his features into an ugly grin; but he answered nothing.

'Well, I'm waitin', Chuckhalter. You see, it couldn't be done; or I'd 'a done it, surely. But how's the job to be finished off now? What do you say—shall it be knife or pistols?'

'If you are wise, neither. You are no match for him whom you call Wild Will. I say watch, and wipe him out with a snap-shot as he goes to his diggings.'

'What! and be lynched? The boys 'ud be certain to spot me.—No; not that game, old boy, anyway.'

'Take your own course, my friend; only, don't expect me to bury your carcase.'

'All right; cease your croaking, can't you!'

Perhaps Colorado Jack saw the angry flush mount to his companion's brow; anyway, he proceeded more quietly: 'You go, Chuckhalter, and see that old dunderhead, Coldey, and arrange this affair for me. Tell him that I select bowies, across a handkerchief to-night, in one of Moriarty's rooms.'

The Mexican looked at his companion with a glance equally composed of surprise and admiration, as he replied: 'It shall be done. And I hope you will come safely out of it; that I do, Jack, with all my heart.'

'I don't care much; but I'll take good care that he shan't.—Go now, and remember that I have entrusted my honour into your hands.'

Honour! How easily may the word be degraded!

Meanwhile, Wild Will and his friend Colonel Coldey had been talking together in a low tone. The colonel was a Virginian, and therefore a gentleman. He had seen service, having been severely wounded, under Beauregard, at the battle of Bull Run. Like an old war-horse, he felt his blood quicken at the prospect of a fight.

Wild Will was speaking. He said: 'I scarcely know what to suggest, colonel. You understand these matters as well as I do; only be good enough to consult me before deciding anything, for I should not like to take a mean advantage of even such a coyote as Colorado Jack.'

'Let your mind be easy, my friend,' answered the old soldier; 'your interests will not suffer in my hands.'

Just then the Mexican, Chuckhalter, sheepishly approached and requested an interview with the colonel on behalf of his principal. This was immediately granted, and Wild Will withdrew.

'Capital!' chuckled the warrior cheerily as he listened to the Mexican's proposals. 'Neat, close, and about fair for both men. Your fellow is plucky, too. Dash my wig! I had hardly expected it of him. To meet Will with the bowie. H'm! Rather he than me.'

'Then we may look upon it as settled that they fight it out here to-night?'

'Not so fast. I had nearly forgotten. I must speak to my man first; but there is no doubt he will agree.'

'He must do so,' responded the Mexican, 'or else Jack will publicly cowhide him into dog's-meat.'

'Tush, tush! Don't rave. Jack would not dare to do any such thing. However, just wait half a minute.'

The colonel unceremoniously adjourned the meeting, in order that he might confer with Wild Will.

The principal listened in silence until his second had concluded; then decisively shaking his head, he said: 'No, old friend; it wouldn't do at all; I must refuse.'

The colonel, with a look of surprise, fell back. Had he, after all, over-rated Wild Will's courage?

'Nay; I mean no offence, least of all to you; but hear me. I ask you now, squarely, are Jack's terms fair?'

'They are bold ones. He certainly is no coward,' the colonel responded.

'It is not that. See!' And the famous scout raised himself to his full height as he said: 'I once fought four Indians at once, when only armed with a bowie knife. I am able to hit a dollar with it at thirty feet. There is not a man in the territory whose eye is as quick and hand as sure as mine is. No; I won't meet the fellow so; it would be simply murder.'

'But the terms are of his own choosing.'

'What does that signify? I am the challenged one. If I meet Colorado Jack in deadly strife, it must be on equal terms.'

'I know it, Will—I know it!' So saying, the veteran clasped the scout in his manly arms.

'These, then, my trusty comrade, are the only terms on which I will consent to meet him;' and Will went on to speak earnestly, in a low but animated tone.

'Good. But think, lad, you will be running an awful risk.'

'It cannot be helped. It is about the only fair way that I can think of.'

The Mexican emissary of Colorado Jack was beginning to grow impatient, when his restlessness was checked by the colonel's return.

Colonel Coldey's first words were: 'I have to inform you, sir, that my principal declines your proposition.'

The Mexican sprang excitedly from his chair. 'But he cannot. He is bound'—

'Excuse the interruption,' interjected the old soldier; 'we are the challenged party, and so have the right of choice. Here is our proposal. Let your principal be on the prairie on the southern side of the city in one hour from now. You and I, sir, must be there somewhat earlier. The weapons will be named on the ground.'

'Sir! I really must refuse'—

'Pardon. I think, Mr — Eh! Ahem! our conference is ended; and as I have a pressing engagement, I must request that you will excuse me.' So saying, Colonel Coldey withdrew, leaving Chuckhalter to digest his chagrin as he best could.

The great prairie to the south of Custer City

was infested with prairie-dogs, a kind of marmot whose deep burrows constitute a constant source of danger to cowboys and horsemen generally. These burrows are favourite places of resort for the deadly rattlesnake ('*Crotalus horridus*'), which—so the miners and trappers believe—dwells in peace with its marmot host.

The sun was setting, a great red ball, in the west; the long shadows of the hills lay athwart the prairie, when the seconds met. The two spoke together for a few seconds; and the Mexican laughed convulsively as if at some singular pleasantry. Then they wandered into the thick sagebrush, and were busily engaged poking aimlessly into the holes of the prairie-dogs, when the two men who were intent upon a deed of blood were seen approaching from opposite directions.

The four men met. The principals bowed in silence. The seconds withdrew a little apart, then returned, and the colonel spoke. He said: 'Gentlemen, we need not waste any time. Unless Jack will apologise and withdraw his challenge, we may as well proceed to business. The light is already failing.'

At this, Colorado Jack could not contain himself, but with a saturnine laugh, exclaimed: 'I apologise! Well, by the jumping Jehoshaphat, but that's cool. I only hope Will here won't down on his marrow-bones, the white-livered cur.'

Even the Mexican had the grace to look ashamed at this outburst, and laid his hand upon the arm of his brutal principal. 'Don't let us talk like children,' interposed the scout, 'when we ought to act as men.'

The colonel only ignored the vulgarity, and said: 'These are the terms of this duel. We, as your seconds and guardians of your honour, have mutually agreed upon weapons.—Colorado Jack,' he continued, turning towards the man whom he addressed, 'it is well known to us that you are not Wild Will's equal either with pistol or knife; so, in order to make the chances square, we have decided that you two shall each place your bared arm up to the shoulder in the hole of a prairie-dog, such hole being selected by us as seconds; the one who escapes being bitten by a snake to be the victor.'

'Strike me blind if I do!' yelled Colorado Jack.

Wild Will smiled, and said simply: 'I agree.'

'Gentlemen,' exclaimed the colonel, 'you will do exactly as we have arranged; or'—he paused significantly—'I shoot the one who refuses.' He went on: 'You will draw for choice of holes.—Now, Jack, you first. Observe! It is black for the right, white for the left.'

Jack sullenly reached out his hand.

'Ah! you have the black. I wish you luck. Half an hour is the time, gentlemen.'

The participants in this singular duel were then placed in position. Colorado Jack, with white face and trembling limbs, threw himself upon the sward and thrust his arm into the awful orifice. Wild Will, having first lighted a cigar, calmly followed his opponent's example. So the two remained for the space of half an hour.

The two seconds meanwhile looked on, quietly smoking, as only Western men can and do.

At length the allotted time expired. The signal

was given, and Wild Will rose calmly to his feet. Colorado Jack did not stir. When they raised him, he was dead. Yet his arm was uninjured.

'How do you suppose it was, pardner?' inquired a miner the next day, of the Mexican, Chuckhalter. 'They say as how old Jack wasn't bitten by any o' the warmints.'

'I can't tell how it was,' replied the other. Then, lowering his voice: 'Madre de Dios, do you think that there really is a God? Surely there must be, for when that old firebrand soldier was not looking, I tried to do our friend a good turn, and made sure that there was no snake in his hole. But it was of no use, you see, mate; he got wiped out all the same.'

'And Wild Will is the hero of the hour.'

'Yes; but let him watch: Jack has left friends behind who will avenge his death.'

Not long after this, Wild Will visited the new mining camp at Deadwood. He was sitting at a table playing cards, when an assassin came up behind, put a revolver to his head and fired, killing him instantly. A dozen hands flew to as many pistols; but the murderer had gained the door; turning for a moment, he displayed the features of the Mexican, Chuckhalter; then he threw himself upon a fleet horse, and galloping off, was lost in the darkness.

The next day the great scout was buried. Beside the dead man lay his rifle and pistols, which were to be buried along with him. The funeral service was brief but impressive, and at the close of the ceremony, the mourners walked in lowly procession past the pit of death, each one taking a last, long, sad look at the spot where their hero lay buried. When the last had gone, the sextons did their work, and filled in the first grave in Deadwood.

D E A D.

Oh weary eyes! that oft did weep,
Closed now: rest well in dreamless sleep.

Oh tired hands! that did their best,
Lie still—be folded into rest.

Oh heart! so torn with love and pain,
Thy troubles ne'er can come again.

Oh busy brain! so full of thought,
Thy work is ended: all is nought.

Oh feet! that trod life's stony road,
There's rest for you 'neath grassy sod.

Oh fragile body! sad and worn,
Rest thee—ah, rest thee from life's storm.

And thou, oh soul! that wing'st thy flight
From earth's dark prison into light—

Great gain, oh soul! be thine for aye—
From earth's dark night to endless day.

THE ORDER OF THE GARTER.

FROM very early times, decorations of one kind or other have been bestowed by most nations on those who have rendered their country some distinguished service; but to trace the origin of these marks of royal favour is no easy task, unless we assume that such a custom was in vogue so far back as the time of Pharaoh, who, as we are told, 'took off his ring from his hand, and put it upon Joseph's hand, and arrayed him in vestures of fine linen, and put a gold chain about his neck.' This mark of royal approval, it is true, made Joseph no member of a companionship such as the subject of this article indicates. The passage, nevertheless, is interesting, as showing the existence, even at that early period, of a custom not dissimilar to that of the present day.

Perhaps in no other country, in this nineteenth century, are orders of distinction bestowed with greater liberality than in France. In this country, however, such rewards are distributed more sparingly; and it may be truly said that, as a consequence, they are highly appreciated by those fortunate enough to possess them. Of the limited list of the Orders that now exist—and they amount only to ten in number—the most highly prized and the most ancient is 'The most noble Order of the Garter.'

Before proceeding farther, it will be well to endeavour to account for the introduction of these Orders, or Companionships, as they are termed, and to do so we shall have to go back to the end of the eighth century. Then it was that chivalry in all its splendour existed, and Europe was overrun by wandering adventurers, only too eager for any hazardous enterprise likely to bring riches and fame. When any perilous enterprise was undertaken by these adventurers, they would often combine together, under the common designation of Companions or Fraternities of Arms. Eventually, we are told, these armed fraternities became so powerful in their influence as to necessitate the establishment of

fellowships on a more extended scale; and, in imitation of the monastic societies, there was instituted a system of military Orders. The system having fallen into abeyance, it was not until the reign of Edward III. that its revival took place. Being engaged in hostilities with France, history records that Edward expected to derive considerable benefits by gathering around his standard and attaching to his person the élite of the European knighthood; and this, it is supposed, is the origin of an Order that has now been in existence for more than five centuries, and which is looked upon as the proudest decoration of the most illustrious of our nobility.

Much has been written by way of dispute as to the precise date of its institution, as well as to the circumstances which led to its adoption. Some authorities aver that 1346 was the year of its introduction; others place the date three years later. None seem absolutely certain on the point; but most agree in the later date. The circumstances connected with the foundation of the Order are known, perhaps, to every schoolboy; but as the romantic account has been variously told by different writers, it may be of interest to repeat that given by the greatest authority on the Orders of knighthood, Sir H. Nicolas. He relates that, during a festival at court, a lady happened to drop her garter, which was taken up by King Edward III., who, observing a significant smile among the bystanders, exclaimed: 'Honi soit qui mal y pense' (Dishonoured be he who thinks ill of it). Many writers have scouted the idea of such an episode having any truth attached to it; it may be well, therefore, to quote the reasons given by the authority referred to for accepting the incident as one worthy of belief. In commenting upon the story, Sir H. Nicolas states 'that in the spirit of gallantry which belonged no less to the age than to his own disposition, and conformably with the custom of wearing a lady's favour, and perhaps to prevent any further impertinence, the king is said to have placed the garter around his own knee.' He adds, and with reason, 'that

an anecdote so much in accordance with the manners and feelings of the times is very likely to have occurred.' Hot dispute has reigned, too, as to the name of the lady who forms one of the principal characters in the incident: some writers name the Queen, others the Countess of Kent; but the one most generally associated with the story is the Countess of Salisbury.

It is not generally supposed that the circumstance related was the primary cause of the institution of the Order, but that Edward had previously determined to form a knightly band in imitation somewhat of the knights of the Round Table of King Arthur; and that, not having decided upon an ensign by way of distinction, he was glad to embrace the opportunity of adopting one arising from the above incident.

The Order is frequently referred to as the 'Order of St George,' which is to be explained by the fact that, in accordance with the practice of nearly every other country professing the Christian religion, the fraternity at its foundation was placed by Edward III. under the special protection of a saint—namely, St George—who for ages had been considered the guardian and protector of England; hence St George has always formed part of the title of the Order, the chapel at Windsor having been especially appropriated to its service. There each knight has his stall, above which are placed his banner, sword, helmet, and crest.

At its foundation, the habiliments of the Order consisted simply of the garter, surcoat, mantle, and hood; to which have been added the collar and George in the reign of Henry VII.; the star in the reign of Charles I.; and the under habit in that of his son.

Before passing on, a few details in reference to the several habiliments may be interesting. The garter is of dark blue, edged with gold, and bears in gold letters the familiar motto, 'Honi soit qui mal y pense.' The buckle is of gold, and is richly chased. This emblem is worn on the left leg. It is permissible for a knight of the Order to enrich the garter with precious stones, if he so pleases. That worn by Charles I. at his execution was, it is stated, inwoven with as many as four hundred diamonds—a luxury indulged in, though to a less extravagant extent, by several companions of the Order of the present day. The mantle is of purple velvet; while the hood and surcoat are of similar material, but of crimson colour. Formerly, these vestures were covered, or 'powdered,' as it was termed, with garters containing the motto. The collar consists of twenty-six gold pieces, each in the form of a garter, and from the centre piece hangs what is familiarly known as the 'George,' which is a figure in gold of St George on horseback encountering the dragon. Since the year 1519, however, it has been the custom on state occasions to dispense with the wearing of this figure, which is somewhat heavy and large in

size, and to wear in its place what is styled the 'lesser George,' an ornament of smaller size and weight. The star is of silver, of simple design, and consists of eight points.

It is not of course necessary that a knight of the Order should have all the insignia on his person on state occasions, although it is incumbent upon him to have displayed upon his person some part of the decoration. Formerly, it was the law that a knight should never be without his garter; later on, he was permitted, when on horseback, to wear in its stead a blue lace or thread round his leg; but this practice has long since fallen into disuse.

At the time of the foundation of the Order its knights numbered twenty-five, exclusive of the king. No change occurred until 1786, when the Order was enlarged by the inclusion of seven more knights. A second enlargement took place in 1805, and a third in 1831, by which the lineal descendants of George I. and George II. were included. The Order now numbers fifty knights, not including the sovereign, and has in its ranks most of the royal family, emperors, kings, and foreign princes, besides dukes, earls, and marquises. In the earlier days of the Order, gentlemen of every class were held eligible, under certain conditions, to the Garter, whereas now it is restricted to the most noble in the land. Ladies, too, in former days frequently figure as holders of the Order; but since the reign of Henry VII. no lady, unless she be the reigning Queen, has been considered eligible for the decoration. The question of reviving the old and interesting practice of bestowing the decoration upon ladies, when the garter was worn upon the left arm, is one that has often been discussed, but without result.

It is curious to learn that some twenty-five years ago there was discovered a manuscript which is declared to be in the handwriting of Edward VI., being a draft of some improved rules which it was intended by certain reformers to have substituted for the original rules relating to the Order. The original statute was not, however, materially altered until the reign of Henry VIII., and the manuscript in question is now in Her Majesty's library at Windsor.

Up to the time of the reign of George III., it was the custom to hold an annual feast of great splendour in connection with the Order; but nothing of the kind appears to have taken place since that time; even the Chapters of the Order, which used to be held on all occasions when knights were installed, and which involved some ceremony, are now almost always dispensed with by royal warrant.

There are several important offices belonging to the Order of which mention should be made. Thus, there are the Prelate, the Chancellor, and the Registrar of the Garter; besides which, there are Black Rod, and Garter King of Arms, commonly known as 'Garter,' the last of which is

the most important office of all. Certain fees are payable by those installed, which vary according to the rank of the individual. In cases of installation of a foreign king or prince, however, the fees are paid by the State.

Special interest attaches to the subject of this Order at present from the fact that there are three Garters vacant, the vacancies having been brought about by the deaths of the king of Württemberg, the Duke of Bedford, and Earl Granville. At the time when we write there is much speculation in the high places of the world, as also in political circles both at home and abroad, as to what distinguished men shall be chosen by the Queen as the recipients of this great honour.

Sometimes the Garter is worn in a curious order of succession. For instance, the decorations of this Order with which George IV. was invested on his accession to the throne in 1820, had only been worn by two persons since the reign of Charles II. They had been conferred by that monarch upon the Duke of Somerset, who lived till 1748, when the same decorations were conferred upon George III., and after him upon George IV.

Before concluding the subject, reference should be made to the fact that several instances have occurred in which a knight of the Order has been degraded therefrom. Happily, the last instance dates back as far as 1715, when James, second Duke of Ormond, was degraded, after having been convicted of high-treason, that offence and cowardice being the only crimes for which a knight can be degraded from the Order.

The ceremony observed when a knight is found guilty of such an offence is that, at the next Chapter following his conviction, Garter is commanded to attend certain knights who wait upon the convicted one. 'Garter' then, in solemn manner, receives from him the garter, George, ribbon, &c., and proceeds, with the knights following, to the chapel at Windsor, and takes down from his stall the 'achievements,' which, according to the words of the statute, are 'spurned out of the choir into the body of the church, out of the west door over into the ditch.'

The most notable instances, previous to the year 1715, in which this disagreeable but curious ceremony has taken place, are those of Sir Gaillard Duras in 1476, the Duke of Norfolk in 1546, and of Lord Paget in 1552. It is only fair to state, however, that in the case of the two last-named personages they were both subsequently restored to the Order after Mary Tudor came to the throne. In 1569 is recorded the case of the Earl of Northumberland, who was degraded after having been proclaimed traitor. Lord Cobham in 1604 was similarly dealt with, after conviction for high-treason; but as the record states, 'by the king's clemency, his achievements were only spurned out of the church door, and not into the castle ditch.' No other case seems to have occurred until the year 1685, when the Duke of Monmouth was degraded by the king's warrant.

It is not possible, within the limits of a magazine article, to touch upon all the matters that

have relation to this Order; suffice it to say that those inclined to probe the subject more deeply will find it one surrounded with much that is curious and interesting.

A SOLDIER AND A GENTLEMAN.*

CHAPTER XI.—'GANG AFT A-GLEY.'

FERRERS came from his hiding-place as soon as their footsteps had died away, and, without quite knowing how he did it, felt his way out of the room, along the corridor to the foot of the chief staircase, and so to his bedroom. He scarcely knew himself in his turmoil of feeling. He felt humiliated more than he could have conceived, choked with resentment and rage against Sir William, and withal disposed to allow that he endured no more than he deserved. His treatment at Dawlish Place had fed his pride and ambition—such pride and such ambition as dwell in every healthy mind—and had deceived him into thinking that after all he might be a person of consequence; now the terms in which Sir William spoke of him showed him what he really was: a common, stupid hireling!—a catspaw for the needy and nefarious baronet!

Moreover, the baronet had simply and crudely lied to him, and he had been fool enough to accept his lies as confidence given in honour by one man to another!—fool and blind enough to believe that Dolly, the frank and unsuspecting, was in her uncle's plot to secure the hold of her property from her trustees! But, he thought obstinately—the fighting spirit was rising in him—Sir William Dawlish was not yet rid of him.

What were the assured facts with which he now must deal? First, there *was* a real William Dawlish to whom it was intended that Dolly should be married to save the baronet's family from ruin; second, the marriage could not be compassed openly, because, for certain reasons—reasons of health, apparently—it was feared that Dolly's guardians or trustees would not accept the real William Dawlish as her husband; and third, it was hoped that, in the last event, the marriage would be effected, and the whole mean scheme crowned with victory by an appeal to Dolly's sense of the family honour. Against these things was set the single possibility that Dolly's love for him, though it had been given as to William Dawlish, might have grown to such strength that she could not withdraw it when she knew him to be George Ferrers. To punish and defeat Sir William he was ready to put that possibility to the test.

Yet, on the other hand, his own admiration and love for Dolly were too high and pure and unselfish to permit him to use the advantage which he had acquired by a trick—by a trick, too, not of his own devising. Would he not feel himself a common, mean cur if he went to Dolly, and said in effect: 'You thought me your cousin and a gentleman, a man of your own rank and station, and you gave me the love which you would never have thought of bestowing on a common penniless soldier, however handsome and honest he might be; but I have won that love, and I claim it?'

No, no; he could not say that. He did not believe that Dolly would have loved him if she had only known him as George Ferrers—he had not so great a conceit of himself; and, that being so, he would not take advantage of his own deceit and of her weakness. Besides, who was he to interfere in the private concerns of the Dawlish family? He had engaged for a sum of money to perform a certain part, and he ought to be content if, when the business was done, he received that sum. How he hated himself for not having put an end to the business when first he suspected its quality.

But he put these thoughts away; whistled softly to himself as he finished undressing; blew his candle out; and got into bed. And soon he slept the sleep of the seasoned soldier. He could not have slept long—though how long or how short a time he could not guess—when he suddenly woke with a rude sense of choking. He put up his hand, and caught a lean and nervous thumb and fingers from his throat! Then he opened his eyes, looked up, and saw by the vague light filtered through his window-blind a figure in white stooping over him. He was at first inclined to suppose himself suffering from nightmare; but the next moment he understood that was impossible, for his hand grasped a substantial wrist. He neither struggled nor cried out; and the creature clawed with its free hand at his hair.

'Come, stop that!' said Ferrers.

But the creature continued with frantic energy, tearing at him with the one hand and trying to free the other. Ferrers was a dalesman and a wrestler, and with a rapid and adroit movement he had the creature's arms pinned at its sides, while he held its body as in a vice between his knees.

'Now,' said he, 'tell me who you are and what the deuce you want here!'

But the creature only struggled and panted.

'Tell me,' repeated Ferrers, shaking him, 'or I'll squeeze the life out of you!'

'I'm William Dawlish,' said the creature, 'and I've more right here than you.'

'Oh,' said Ferrers, 'you're William Dawlish! I must have a look at you.' The devil-may-care spirit of the old soldier was roused. 'Now,' said he, 'you see you can't do anything with me. Will you sit quietly in a chair, or must I tie you?'

'I'll sit,' said Mr Dawlish.

'On your word of honour?'

'On my word of honour.'

Ferrers then let him go, jumped from bed, and lit the candle by his bedside. He set a chair for his strange visitor, while himself put some clothing on, and sat on the bed. He looked with great curiosity at the person he was supposed to be—at his other self, who drew his night-shirt about him and sat down in the proffered chair. He was about as tall as himself; he was indeed something like what himself might have been, had he started with a feeble constitution and been grown in a poor soil. He had hair like that of Ferrers, but finer and thinner, with a longer nose, a weaker mouth, and a far less generous moustache. But the most notable difference was in the meagreness of the body—Ferrers recalled the phrase of one of the 'Johannes'—'like a monkey up a stick'—which had the shoulders

of a bottle and the chest of a pigeon. There was something, too, of a wild and bloodshot look in the eye, which made Ferrers suspect he was not quite sane. Having thus considered him a moment or two, Ferrers pitied him.

'Now, Mr Dawlish,' said he, 'do you mind telling me why you have visited me in the middle of the night in this polite and—friendly way?'

Mr Dawlish's only answer for a moment or two was a wild and irrepressible burst of laughter, which sounded half hysterical. He swayed to and fro and laughed; he leaned his face in his hands and laughed; and then he threw himself back in his chair exhausted, with tears of laughter streaming from his eyes. He had no sooner looked at Ferrers' composed and somewhat wondering face, than his laughter burst forth again.

'Ah-h! Ha, ha, ha, ha!'

'Look here!' said Ferrers sharply. 'You'll wake all the house.' He looked him steadily in the eyes, and that seemed to have a controlling and composing effect upon him.

'Oh, I say!' cried Mr Dawlish. 'You are a caution! "Visit me in a polite and friendly way," says you!' And he laughed again. 'You're a strong beggar, though. I wish I was as strong as you. I'm not bad for strength, you know, and figure; but I'm not so good as you. Look; my calf's not half bad. They used to say it was the nicest-shaped leg they knew.'

'Who used to say that?' asked Ferrers.

'Oh, some friends of mine.—I've a good biceps, too,' continued Mr Dawlish, undoing his sleeve and baring his arm.

'Oh yes,' said Ferrers; 'it's pretty fair.'

'I say,' observed Mr Dawlish, as if he had suddenly remembered something of consequence, 'you've just come from town—haven't you?—with the other people.' Ferrers nodded. 'What's doing at the theatre? What girls are at the Gaiety now? Anything much?'

'Oh,' said Ferrers, becoming rather weary of the young man, 'they're all right, I believe.'

'Tootsie's gone, of course. Did you know Tootsie?'

'No, I didn't.—But look here, Mr Dawlish,' said Ferrers, 'you didn't come into my room in the dark and take me by the throat merely to have an agreeable chat?'

'I say,' laughed Mr Dawlish again, 'you are a caution. I like you, you know. I apologise—I do—for being ungentelemanly to you at first; for I know you're a gentleman. He told me different.'

'Who told you different?' asked Ferrers.

'Oh, never mind who told me. But I thought, you know—and he glanced round and lowered his voice, as if he feared there might be another within earshot—that I had hold of one of those old banker chaps that keep my governor so short that he can't give me any money. I haven't had a spree for I don't know the time!'

'That's bad,' said Ferrers. 'And are you kept stuck down here all the while?'

'Oh no. I've been staying with Dr Blobbs. I'm better now; but I've been awfully seedy. They say I've had something wrong with my head, and, you know'—He leaned forward and whispered another sentence in Ferrers' ear.

'You don't say so!' said Ferrers, looking at

him with half-averted eyes. 'Well, I advise you to get back to bed as quick as you can.'

'Hush!' said he. 'I've given my man the slip. He mustn't know, or there'll be a frightful shindy. I'll get back all right.' He rose and held out his hand.

'I'll see you safe to your room,' said Ferrers. 'You know the way, I suppose?'

'Of course I know the way. What do you take me for?'

They left Ferrers' room, and traversed a long passage, which turned this way and that. They then passed through a door into a long ample room lighted from the roof, which Ferrers recognised as the Picture Gallery.

'All my forefathers and foremothers hanging round here,' said Mr Dawlish.

'Yes,' said Ferrers; 'I know.'

'Sometimes,' said Mr Dawlish, 'I come in and look at them, and cock snooks at them. A lot of auctioneer's rubbish! When I come into them, I'll sell 'em off, like what's-his-name in the play.'

'That would be fun,' said Ferrers.

So they passed on, and out through the little door at the other end, and up a narrow staircase.

'Hush!' said Mr Dawlish, and stole into a low room whose door was ajar, and in which a night-light was burning. 'My man's asleep,' whispered he, and pointed to a narrow truckle-bed in the corner. 'He had a drink with a chum.'

He said 'good-night,' and passed into the room beyond, and Ferrers turned at once to the sleeper in the corner and shook his shoulder. In stooping over the man, his eye caught sight of a slipped foot, a man's foot, peeping from under the bed. He knelt and seized the foot, and with a powerful tug drew out the body to which it was attached, while the sleeping man started up and rubbed his eyes. The man drawn from under the bed started to his feet with an oath, and revealed himself as the black-muzzled Irish-American! Ferrers at once suspected that he was the 'chum' with whom Mr Dawlish's keeper had had a drink, and who probably had urged the young man to prowl into the stranger's bedroom.

'What are you doing here?' demanded Ferrers, in a quick low voice (the whole scene passed in tones little above a whisper).

'Sure,' said the man on the bed, 'he's a friend av moine.'

'And between you,' said Ferrers, 'you have let your patient out. He has been wandering about the house and into guests' rooms.'

'The divvle he has!' exclaimed the man, and jumped from bed. 'Where is he?'

But Mr Dawlish himself had appeared by that time, looking in mortal fear of his Irish keeper. 'Come now, Murphy, hold on!' he cried. 'It was your friend that took me out and showed me into this gentleman's room. He told me he was one of the bankers.'

'What have you got to say to that?' asked Ferrers, turning again to the scowling Irish-American.

'Nothing,' said the man; 'and it'll be the worse for you if you say anything.'

'What is that?' said Ferrers, taking him by the ear.

'Come,' said the man, trying to strike down his hand; 'none of your games with me. I know all about you, and there's more will know about you before I've done. So take care.'

That he should hold high debate with himself about making all the truth known, and that at the same time this mean, spying cur should with a word or two be able to betray him, enraged Ferrers.

'Very well, my friend,' said he, pulling the man's ear—while Mr Dawlish stood aloof, rubbed his hands, and exclaimed, 'Here's a spree!'—'you know me. I've punished you for rudeness before, and I'll punish you for impertinence whenever I know of it. If ever I hear you speak of me, or hear that you have spoken of me, to any one, I'll find you out and give you such a thrashing and such a ducking as you never had before. You understand?'

He gave the ear he held an admonitory pinch, which provoked the man to strike out with hands and feet. Upon that, with little ado he took the man by the hands and feet, gathering them in one great grasp as if he had been a bound sheep, shook him, and said, 'Be quiet!' Then, seeing the door of a clothes-closet stand open, he flung him in, turned the key, and put it in his pocket, while the artless Mr Dawlish exclaimed, 'By gum! Ain't you a strong beggar!'

'Don't lave him there, sorr, if you please!' said the attendant Murphy. 'He deserves it all; but it ud ruin me wid Sir William if he knowed he'd been here!'

'All right,' said Ferrers, handing him the key, and thinking that after all none of these things mattered very much now; 'let him out by-and-by, and tell Sir William what you like.'

'I'll tell Sir William nothing, sorr, wid your lave,' said Murphy, while Mr Dawlish ejaculated, 'What a lark!'

So Ferrers returned down the little twisting staircase into the Picture Gallery, in passing through which there broke on his ear from the room he had left 'a horrid idiotic laugh,' and he understood the cause of Dolly's fright on the night she waited for him. It struck him as a coincidence to note as curious that while Dolly had been expecting the pretended William Dawlish, the real should have unwittingly made his voice heard by her. Poor, dear Dolly! What was now to happen to her? Was she to be permitted to move on blindly, deceived or persuaded by her uncle, into marriage with that unwholesome and imbecile cousin? A thousand times 'No!' The very thought of it was revolting and maddening, and Ferrers at once and for all resolved to purge his soul of offence in the matter.

When he got back to his room, he sat a while on the edge of the bed, stared at his candle, and rubbed his cold shirt sleeves. He thought of all that had passed in the very short space of time since he had made Sir William Dawlish's acquaintance. Into what a vortex of deceit had he been caught! And yet, to begin with, yea, throughout, he had meant no harm. Tempted by money, which at the time had meant to him food and lodging, he had thoughtlessly embarked on this adventure, which was now threatening to engulf himself and his prospects, and to make shipwreck of the happiness of the best and dearest

girl in the world—the only woman whom he had ever completely and unreservedly admired and worshipped, who had ever made him feel what the romance of love might mean. For himself, such a fate scarcely mattered; he was a penniless soldier, a man of no account; but as to her!—not a hair of her dear head should be ruffled if he could help it! And yet his punishment was that things could not possibly be set right without ruffling and perhaps paining her. But he would not spare himself; he would urge no extenuating plea in setting the truth before her on the morrow. She might despise him, hate him!—it might indeed be better that she should—but in any case the rude, ugly truth must be laid bare!

Having thus finally determined to make an end, he was in a strangely quiet condition of feeling, which rather surprised him: he could not remember ever having felt anything like it except on the eve of a battle. And in that feeling he undressed, blew out his candle, and got into bed. But in the dark he was wider awake than before, and went over and over the ground he had already traversed, with intervals of sleep and of dream, until the daylight began to show on his window, and the birds awoke to chatter and chirp, and to chaffer and haggle over straws and worms.

(To be continued.)

FIRES ON COTTON SHIPS.

THE manufacture of cotton goods must be placed in the front rank of British industries. Its importance, however, must not be assessed solely on account of the number of persons it finds employment for within the limits of the British Isles. Cotton freights form a very considerable factor in the shipowner's income; and the carriage of raw cotton from countries overseas to the British ports, whence it is disseminated among the various cotton manufacturing districts, finds occupation for many vessels of our mercantile fleet.

The records of maritime disaster show that this sea-carriage of cotton is attended with very serious risks; and these risks, instead of diminishing with the development of naval and marine science, seem rather to be on the increase. That occasional fires should break out on cotton ships is only to be expected from the nature of the cargo; but that they should occur with the frequency that has marked their occurrence during the past few years, affords matter for the gravest consideration. The cotton season proper begins in September, and ends in March; so that the carriage of cotton is not evenly distributed over the whole year, but is practically confined to seven or eight months out of the twelve. Yet, during the season 1887-1888, there were in the transatlantic trade alone twenty-two fires on cotton ships after they had left American for European ports; and eleven at the ports of loading. Season 1889-90 produced twenty-two fires after sailing, and twenty-two at the loading ports. The magnitude of the list is startling; but the majority of the cases escape public notice; and it is not until the occurrence of a maritime disaster akin to that which sealed the fate of the Atlantic liner *Egypt*, that the national attention

is directed to the conditions under which the sea-carriage of cotton is prosecuted. Before proceeding to discuss these, it would be well to remark that the above statistics refer only to the American cotton trade. During the same period the Egyptian and Indian cotton trades were marked by an immunity from disaster most marked when compared with that occurring in the Atlantic trade. What few fires did take place were of the most trivial nature possible; in fact, it is no overstatement of the case to say that fires are practically unknown on board ships laden with Egyptian or Indian cotton.

As to how the fires among American cotton cargoes are produced there is no exact evidence to show; the most careful inquiries have failed to trace any outbreak to a definite specific cause. It may be instructive, perhaps, to briefly review the circumstances under which some of the most important of these fires occurred.

The *Egypt*, a ship of 4670 tons gross, well known in the Atlantic trade, left New York with a crew of ninety-five all told, a cargo of cotton and general produce, and several hundred head of cattle. The breaking out of the fire—the heroic efforts on the part of the officers and crew to extinguish it—the horrors attendant upon the burning of the cattle, and the subsequent mastery of the ship by the flames, and her abandonment in mid Atlantic, are still fresh in the minds of all. In this case the origin of the fire could not be accounted for. The shipment was effected even under more favourable conditions than usual. As far as could be ascertained, the regulations of the port authorities relative to safeguards against fire appear to have been rigorously complied with, and the cotton while lying on the wharf or on lighters was protected by tarpaulins, so that every reasonable precaution seems to have been adopted to ensure safe stowage on board the *Egypt*. The general conditions of the vessel relative to her cotton carriage were identical with those obtaining on one hundred previous voyages. The cotton was protected from contact with the casing of the boiler, no naked lights were used below; so that the only tenable theory as to the outbreak is, that an unnoticed spark must have found its way into some bale during shipment, and the cotton in its vicinity must have smouldered for close upon a week, when the dense smoke made the presence of fire patent to the crew.

That cotton will smoulder without actually bursting into flame, the number of fires which are observed in the holds of cotton-laden ships when the hatches are removed for discharging proves conclusively. In many cases, the removal of the hatches, or the cutting into the deck 'to get at the fire,' only results in feeding the smouldering cotton with the requisite oxygen for a more active and overpowering conflagration. The rapidity with which these fires spread, and the utter impossibility of extinguishing them when they have once established themselves, the case of the *Egypt* shows but too well. She was provided with steam fire-extinguishers, and had five jets, each one and three-quarter inches in diameter, leading into the part of the ship in which was the burning cotton. This would give a total pipe area of about twelve inches; and the pressure of steam available from the boilers was

seventy-five pounds per square inch. In order that the whole of this steam-force might be available, the engines were stopped, and the full pressure of steam diverted to the extinguishers; but it was not sufficient to save the *Egypt*. The flames obtained a complete mastery, and the crew were finally compelled to abandon her.

The past twelve months have been particularly fertile in cotton fires, so that the loss of the *Egypt* is by no means an isolated case. The British steamship *Thanemore*, 3032 tons gross, left Baltimore with a cargo of grain, flour, and cotton, and 430 head of cattle, for London. That port she never reached; and the last human intelligence we have of her is that of the Chesapeake pilot, who in his affidavit says: 'She was in beautiful trim, and that at 5.20 A.M. of the 27th of November (1890), he left her outside Cape Henry.' Her non-arrival at London compelled her owners to consider her overdue, and at length 'missing.' Various surmises were made as to the vessel's fate—severe weather, ice, collision, were all put forward as probable causes of the vessel's loss. But conjecture was at length set at rest by the evidence of the master of the screw steamer *Lero*, who reported that when on a voyage from Sunderland to Philadelphia, 'at 7.20 P.M. on the 1st of December I sighted a vessel on fire, distant about eight miles. . . . The vessel appeared to be a large steamer running before the wind, and had fore and topsail yard on her foremast; and I could not bear up to her on account of the heavy sea running at the time, washing the tarpaulins off my vessel's hatches.' The description and the position leave little doubt as to the burning vessel being the *Thanemore*. The last hours of the crew of the burning cotton ship must have been terrible. If they succeeded in abandoning their vessel, the respite could have been but a temporary one—merely a choice of deaths; while, if the spread of the fire burnt their boats, and thus deprived them of the means of leaving the doomed ship, their end must have been awful in the extreme.

Happily, all fires on shipboard are not attended with such painful circumstances.

The Liverpool steamer *Thessaly*, 1924 tons, left New Orleans for the Continent on the 2d of December last, and was abandoned through fire on the 29th of the same month when off the coast of Holland. Her cargo consisted of 1700 tons of oilcake (crushed and compressed cotton-seed), 1500 bales of cotton, and 200 casks of cotton-seed oil—a typical cotton cargo from New Orleans during the season. The burning of the *Thessaly* presents at first sight a more accountable appearance than the two previous cases; for, on the 28th of December, which was the day on the evening of which the fire broke out, the steam-pipe which worked the winch was frozen, and the captain ordered some hot ashes to be put under it and on the deck near, to thaw it. This cannot, however, be held responsible for the fire, as very shortly afterwards smoke was observed coming from the cotton, which blazed fiercely when the air was admitted to it. The decks became hot, and the vessel had to be abandoned. Her subsequent history furnishes a nineteenth-century ocean romance, unsurpassed by even the wildest flight of fiction. A Danish steam-trawler and two smacks took her in tow,

put five men aboard, and endeavoured to make for the Humber. They towed her until the 4th of January, and then, unsatisfied with their progress, the trawler put into Grimsby to secure the aid of a tug. Then the fleet of Lilliputian salvors took their mighty prize in tow, only to suffer the mortification of her foundering suddenly when a mile and a half off Spurn Point, and carrying two of their men down with her.

In this case, the cotton had been properly stowed and properly protected against fire on board. The conclusion is inevitable from this and the foregoing cases that the fire had attacked the cotton before the vessel started on its voyage.

Before passing on, however, to consider the possible causes and prevention of fires on cotton ships, we will allude to one more instance—that of the *City of Richmond*, an interesting case, because the fire was not extinguished when the vessel reached Liverpool. As in the cases quoted above, the *City of Richmond* was a large vessel, close upon 3000 tons. Her escape was a narrow one, as she carried 298 passengers in addition to a crew of 146 hands; and the danger of the cotton fire was increased by the character of the other concomitants that composed her 'general' cargo. In addition to 2082 bales of cotton, she carried a large quantity of lard, bacon, hams, sugar, tallow, grease, lubricating oil, lard oil, cheese, and fresh meats—a heterogeneous compound that would ensure an ample supply of fuel did fire once establish itself on board the vessel. The fire in this instance seems to have started somewhere before the fore-end of the boiler casing, to have spread fore and aft on each side, and to have raged along at the upper part of the cotton mostly. The deck on which the cotton was carried was practically uninjured; but the iron decks above and the shell plating were much buckled by the fire. In fact, had it not been for the iron decks above the cotton, the steam fire-extinguishers, which, although they could not subdue, yet kept the fire under, and the care that was taken to exclude air from the fire, a repetition of the *Thanemore* disaster would in all probability have occurred. When the space in which the cotton was carried was opened in dock, the fire rapidly developed and necessitated the filling of the space with water before it could be extinguished.

Such is a brief outline of the information obtainable as to the more notable fire outbreaks on cotton ships. Fires of much less severity are quite an every-day feature of the American cotton trade. It is no uncommon thing for bales to be discharged at English ports which bear unmistakable evidence of having been on fire, and disputes as to the receipt of these injured bales are consequently of frequent occurrence. For a long time it was held that there was some inherent difference in the nature of American cotton when compared with that of the East, that predisposed it to ignition—that, in short, spontaneous combustion was liable to occur in cotton bales. A most careful examination by chemical experts, however, has disposed of this theory, and established the fact that American and Indian cottons both need a flame or spark to ignite them; and also, so far as combustible properties are concerned, there is no difference whatever

between them. Of course, the *greasy* nature of the Atlantic cotton-carrier's general cargo introduces the danger of combustion when the cotton is placed in contact with oil; but in the cases we have discussed, every care was taken to separate these two commodities. The carriage of cattle fodder and the necessity of bringing it up from below lends another risk to the Atlantic trade that is absent from the Indian. But the danger from this source is fully realised and just as carefully guarded against; no naked lights are carried below, and the fact that where information is obtainable as to the *locus* of a fire on a cotton and cattle carrying ship, the outbreak is *never* amongst the fodder, shows conclusively that even this element of danger is amply guarded against by the adoption of common precautions.

At the Indian, Egyptian, and American loading ports the harbour conditions are practically the same. Where steam-power is used, sparks will fly, and wharfage fires must occasionally occur. Sparks may even effect a lodgment in a bale of cotton and escape the notice of those engaged in loading. The ultimate effect of that spark is, however, determined not by the native constitution of the cotton, but by the method in which the cotton is packed. It is to the different methods of packing that the Indian cotton trade owes its immunity from fires. The incidental risks accruing from sparks, matches, contact with oil, and want of proper precaution in handling and in transit, are common to the American, Brazilian, Egyptian, and Indian cotton trades; but in the case of the first-named they are enormously increased by the defective packing. A Committee of underwriters convened to consider the question of cotton fires, expressed their views in the following terms: 'The Committee are of opinion that the insufficiency of the packing is the chief cause of the liability of the cotton to catch fire. The packing of American cotton is vastly inferior to that of Indian, Egyptian, or Brazilian, which is entirely covered and properly bound; so that it is exceptional to find any of the latter exposed after landing. American cotton, from the flimsy nature of the packing, only partially covering the bales, and insufficiency of the bands, comes away in considerable quantities; and the decks and holds of vessels loading and discharging are frequently covered with waste and fluff. It is evident that this condition of things renders ignition by sparks or other causes exceedingly likely to occur.' Such is the opinion of recognised experts.

In the Indian trade the material employed for packing is of a much closer texture than that which wraps American bales; the number of bands is much greater, too; and above all, the cotton itself is much more tightly compressed. A bale of American cotton must have its specific gravity increased fully one hundred per cent. before the conditions of packing will approximate to those employed in other trades. There is yet another feature characteristic of the United States cotton traffic that still further increases the risks attendant upon the sea-carriage of cotton. The method of sampling that appears most in vogue consists in making a hole in the bale of cotton *after* it is compressed. The result is that the loose ragged bunch of cotton-down protrudes from

the hole, and this fluff needs but the smallest spark possible to ignite it. If the bale were tightly pressed, the danger from this source would be materially minimised; for, though a spark ignites this loose cotton-down or fluff, the flame passes from one bunch of it to another with lightning rapidity, and does not interfere with the mass of the bale *if it is tightly packed*. When this is not the case, however, the merest spark will burrow into a bale, and the ignited cotton will smoulder in a vessel's hold for weeks, until some inlet of air takes place and fans it into open flame. In India and Egypt, the cotton is sampled before compression takes place.

An interesting experiment was made at Liverpool, which shows the non-inflammatory nature of cotton packed in the Indian manner. A bale of cotton was put on a hot furnace and left there for half an hour. When it was taken off, the outside covering was destroyed; but the bale itself for all practical purposes was a bale of cotton still. An inch was consumed by the great heat of the furnace; but the interior of the bale was perfectly sound, solid, and good. A well-known cotton authority has stated as his opinion that 'whereas with an American bale the smallest spark in the world would cause its destruction; if you give me an Indian bale, you may cook my dinner on it, and no harm will happen to it.' If such be the case, what must have been the danger run by a liner that brought over in a bale of cotton which formed part of her cargo a whole box of matches! How an outbreak of fire was prevented, it is difficult to surmise, for the igniting point of phosphorus is only one hundred and twenty degrees!

The resultant of knowledge, gained by such bitter experience as the history of cotton fires implies, should be the adoption of precautionary measures which aim to secure absolute prevention. Even in the face, however, of such severe teachings, fires on cotton ships are just as liable to break out as ever. Vested interests and the conservatism that resents the adoption of commercial improvements when urged by outside influences, are strong factors in the United States; and the united forces of 'cotton magnates,' underwriters, and shipowners on this side of the Atlantic, are needed to break through them. That this will be done in the future there can be no doubt; but such sweeping improvements as are necessary must be a matter of slow process indeed. Insurance companies are willing to insure cotton cargoes for much lower rates when the bales are packed in the Indian manner; and some have even expressed their willingness to adopt a system of differential rates, charging a lower premium upon those bales packed according to their ideas than upon those sent over packed in the loose and slovenly American manner. It is not often that public companies are prepared to make such a sacrifice to inculcate a principle, for the risk would hardly be diminished in any degree where a cotton cargo was of a mixed description—that is, composed of well and ill packed bales. However, such is the present state of affairs; and it is to be hoped that American cotton growers and dealers may speedily be induced to emulate the praiseworthy methods employed by their *confrères* in India and Egypt.

Until such is done, it is incumbent upon all

carriers of American cotton to adopt every possible safeguard to minimise the risks incidental to the nature of their cargoes. Powerful pumps aided by steam fire-extinguishers will do much towards keeping under a fire; but in the case of cotton ships nothing is so efficacious as complete exclusion of the air; and this is often lost sight of in the mistaken zeal of some masters to find the exact whereabouts of the fire by opening the deck. The *City of Richmond* case showed the serious danger in case of fire to be apprehended from carrying cotton under the passenger spaces. The careless bestowal of cotton waste—that is, cotton saturated with oil and grease, and therefore liable to spontaneous combustion—cannot be too strongly deprecated; and the rigid enforcement of the port regulations relative to smoking, lights, &c., at the places of loading, should be insisted upon. These remedial measures will go far to lessen the risks of cotton fires; but it is not until our American cousins can see their way to adopt the improved methods advocated above, that the over-sea carriage of American cotton will be attended with that exemption from fire-disaster which is such a pleasing feature of the cotton trade of India and Egypt.

ON THE MARSHES OF DEVA.

CHAPTER II.

FOR a moment I was paralysed by the discovery. A rapidly widening band of water fully a quarter of a mile broad, already separated me from the Cop; and I could not swim a stroke. I turned to look for Yethert; but, to my amazement, he was nowhere to be seen; and I suddenly recollected that for some little time I had not heard his footfall behind me. I called aloud; but there was no answer; and I ran back for a moment at full speed, wondering what could have become of him, and calling him aloud. The thought struck me that he had perhaps discovered the danger before I had; and had fled back towards Flint without giving me warning; but the idea was scouted at once, for Yethert knew better than I did that a broad river was now running between the marsh and the Flintshire coast, and that escape in that direction was quite out of the question. I ran for a few hundred yards, and then the futility of such an action struck me, and I stood irresolute. I could now hear the tide moving through the dykes, and I knew they must shortly begin to overflow and inundate the marsh in all directions.

The ground began to be agitated by the mysterious minute splutters and gurgles with which in these marshy solitudes it invariably greets its approaching union with the tide. Some distant sea-gulls rose in the air with wild shrieks and swooped down again and again on the bosom of the body of water that was advancing from the Cop; and several curlews flitted by overhead with shrill whistles. The ever-increasing murmur of the river on the Flintshire side began to sound nearer and nearer, and I felt that I was being closer and closer hemmed in by the merciless waves. The full horror of my lonely death seemed to be suddenly and violently borne in

upon me; and while scarcely conscious of what I was doing, I shouted aloud in my agony for help. A large gull which had been quietly feeding in a pool hard by rose up almost at my feet, and with mocking cries fled with widespread pinions to meet the oncoming tide; but everything else proceeded with a merciless monotony that seemed to double the agony of my situation. The lapping of the water as it circulated through the dykes and the murmuring plash of that ever-enlarging mirror which lay between me and the Cop went on unceasingly, and I could hear the dull intermittent roar of the Chester train as it rushed from station to station on its way to Holyhead. As I turned my gaze in that direction, I could see the numerous furnaces glowing, like the fiery horrors of Dante, out of the dusky cloud-line of coast.

There could be no escape for me without external aid, and again and again I shouted in the faint hope that my distant cries might be heard above the screaming and chattering of the wildfowl, who, in increasing numbers, were gathering about the portion of the marsh where I was penned. Unless I should chance to be heard by some belated member of the Richie or the Denhall households, or by some chance passer-by on the high-road between Burton and Ness, I must inevitably perish.

Forty years before, Abraham's father had been in a somewhat similar plight. He had been surprised by the tide when out at midnight with his gun; and, failing to climb one of the beacons placed to warn mariners of the vicinity of dangerous sandbanks, he thrust the muzzle of his long gun firmly in the sands, and resting the butt against the beacon, stood upon it and clung to the post, shouting meanwhile for help. The tide rose until it reached his armpits; but it rose no higher, and when morning broke he was rescued in an exhausted state by a Connah's Quay boat. This was on higher ground than that where I was now imprisoned, and I knew that in a short time not less than fifteen feet of water would be rolling over the spot. The story recurred to my mind, and other and more ghastly recollections came thronging after it.

I had spent a holiday at Parkgate a few years before, and one night, after the darkness had closed in and the waves were beating on the ancient quay, screams were heard far out in the river. A stranger walking over from Holywell to Parkgate had suddenly found the waves rolling in his path, and rushing frantically backwards and forwards, saw that death had in very truth suddenly overtaken him. I remembered vividly the flitting lights in the upper chambers of the houses on the Parade as the alarm spread, and the flashing lanterns on the quay as the coastguardmen and fishermen put off in the direction of the piercing cries which came without intermission for fully a quarter of an hour, and were suddenly steeped in a grim silence that was unspeakably suggestive. I remembered how some of the older fishermen, who were well acquainted with the currents of the estuary, fished for the body next day with their nets, and recovered it. I could even recall the words on the funeral card that was sent to those who had to do with the matter; and more than once during this fearful night they flashed upon my

mind as if spoken aloud: 'The waves of the sea are mighty and rage horribly; but yet the Lord who dwelleth on high is mightier.'

The tide flows over the marshes in a more deliberate fashion than where the poor stranger was overwhelmed; but it is none the less sure; and in my despair I even wished it was more rapid in its action. It seemed that death was approaching in a fawning dissembling manner, and that its approach would have been less terrible if it had come in the more warlike guise of leaping, storm-lashed waves.

I retired again and again before the advance of the tide, until at last I could distinctly hear the wash of the main body of water that was approaching from the Welsh side. I even fancied I could make out the white tips of the waves as they broke on the marsh and took in pool after pool of water. Numbers of gulls moved over my head within easy range, or alighted in the brimning dykes with a contempt of my presence that seemed to augur ill. It was as if they already knew that I was doomed, and of no further account in the world for good or ill, and that they had nothing to fear from me.

Suddenly, out of the gloom of the marsh behind me there uprose a new sound; and as I strained my ears to listen, I distinctly heard the sound of paddles that struck the water in regular and quick succession. I rushed towards the sound with a glad cry, springing wildly over every obstacle; and was within a short distance of the tide, which now spread around me in an irregular circle, when a white canoe shot out from under the bank of one of the dykes and rushed quivering and dancing out on the river. The occupant paddled with might and main; but when I reached the water's edge, breathless with the exertion and excitement combined, he paused, and the canoe rose and fell on the waves with clock-work regularity. I could dimly make out a figure sitting in the stern and holding the paddles clear of the water. Judging it to be Abraham, who had crossed the marsh in some mysterious manner to my rescue, I eagerly called his name aloud. I had grown hoarse with shouting; but my cry was at once responded to with a surly: 'How go, mester! How go! Lookin' fur ould Yethert?'

I had a vague idea all along that Yethert had taken care of himself in some way, and I now jumped to the conclusion that he had by some means found the canoe and came to save me. In my frantic delight at my approaching deliverance, I felt that I could embrace this strange silent man—all-fitting velveteens and stubbly beard included. He and I would be fast friends, and he should long have cause to bless the night when he took me off that lonely marsh. Thoughts such as these flashed through my brain as I called out to him: 'Come on, Yethert, my good fellow; I have nearly had enough of this. I thought it was all over with me.'

There was a prompt answer from the canoe. 'Well, I'm as good as they make um, Mester Graham; but yer not comin' off theer to-neet!' The paddles dipped in the water as he spoke.

Something in the man's tones thrilled me with the conviction that he was in earnest, and the perspiration broke out on my forehead as I exclaimed: 'But, Yethert, man, you promised to

bring me safely across the river; and you can't leave me here. It would be murder!'

The canoe had drifted a little nearer to me, and he pulled off a yard or two farther away as he made answer: 'Mester, ye may call it what ye loike; but I'm goin'. Do ye think I'd fotch ye all the way fra Flint and lie up to the neck in muck here all this time for nout? Nay, me mon; I'll fotch ye to-morrow! Ye canna swim, they tell me; and I reckon ye'll come quiet enough to-morrow.'

I had stopped at the water's edge; and while this conversation had been taking place, the tide had already risen over my knees; but I waded nearer with a mad idea of making a frantic rush for the canoe, though I knew that it was floating in deep water, and that in all likelihood several submerged dykes lay between us. He noticed the movement, and pulled still farther away from me, adding: 'I fetched a dead un from off here afore, and got five shillin' fur him. Little enough, too, luggin' and draggin' in the mud.'

My heart sank within me as he drawled out the last words; but the offer of my purse and all my belongings for a passage to the Cop only evoked the answer: 'Nay, me mon; I can tak what I want to-morrow. It isna the money I'm after; but I can tell thee this—I'm goin' to stop thee from Aba Richie's wench. She winna tak me, I know; but she shallna have thee. Comin' sneakin' across here neet after neet like a powcher!'

There was no mistaking the intense hatred with which he uttered these last words, and, moreover, he emphasised them by pulling steadily and swiftly away. I waded back out of the tide and on to the narrowing strip of marsh that was left to me, and gave myself up for lost. I had no longer any hope, and I ceased to call for help.

The space now left to me was not more than fifty yards in diameter, and the waves were rapidly annexing it on every side. A number of widgeon were floating buoyantly on the waves near the bank; several gulls were wheeling in the air overhead, and one or two were standing motionless upon the ground within a few yards of me. In a shallow gutter at my feet, two little streamlets came together every other moment with a little shock, and flirited the spray several feet in the air. Little trickling advance guards overran the ground in all directions; but as my death looked me full in the face, I grew strangely calm. Strange fancies took hold upon me as I stood there with the shadow of Death overcasting me.

In my sitting-room at Flint hung a fine engraving of the 'Reaper and the Flowers,' in which the moonbeams lighted up a river scene very similar to that in which I now stood, while the radiant Reaper was to be seen cleaving the air with outstretched wings, and bearing home the newly gathered flower, whose trustful little face rested on his shoulder. Incongruous as the idea may seem, I thought of the picture as I waited there for my death, and I thought, too, of a sweet girlish figure that would be worshipping in the old parish church in the morning, while I lay dead and bedraggled in the marshes. I could see her distinctly as she stood there meekly among the congregation, her little gloved hand

grasping the ivory-backed 'Service' in which I had written some foolish lines to 'Helga Richie'—for it had come to that.

In the few moments that were left to me I knelt down on the streaming bank and prayed earnestly for the life of the world to come.

A terrific report close to my ear stunned me for a moment and sent some of the birds screaming away. I suppose I must have cried out, too, at the same moment, for the next I remember was a powerful but terror-stricken voice calling out: 'O Lord! O Lord! who's that?'

It was Abraham Richie, frightened for the first and only time in his life; and his errand was explained by the circumstance of a number of dead birds being swept about my feet by the waves. My knees shook under me at the prospect of being snatched from the jaws of Death, and I could scarcely utter his name aloud.

He brought the canoe close in to me with the bow chafing and grating on the bank, and peered closely at me.

'Why, lad, lad!' he exclaimed when he was assured that it was indeed me, 'how in the world did you get there?—But never mind now; get in here quick. Steady now; a little thing'll upset it, tha knows.—Kneel thee down close up behind me, and put tha two hands on my shoulders. Steady now, and I'll soon get thee on dry land. Keep tha heart up now!' He could feel my hands trembling on his shoulder—'Keep tha heart up, and we'll be all roight directly.'

We reached the farmstead; and the household was quickly bustling about on my behalf. There was of course no truth in Yethert's assertion that he had been sent for me; and as I unfolded the story of his perfidy, exclamations of horror were of very frequent occurrence indeed. Abraham alone sat with compressed brow and said nothing; but his eyes wandered so restlessly to the rack where his guns were suspended, that his better-half, on noting it, silently went over and sat on the oak settle beside him in such a manner that he could not well get out; and so held him captive until the first fierce desire for immediate vengeance had somewhat subsided.

It was decided to let Yethert 'stand over till morning,' when he was to have been handed over to the local constable; but he was too many for us. He had heard the unusual commotion from his room over the stables; and an hour and a half after my arrival, a slouching individual, whose appearance corresponded exactly with the description afterwards circulated by the county police, passed over Queen's Ferry, and landing on the Hawarden highway, was seen no more. There could be no doubt that he was crazed by a hopeless attachment for his master's daughter, and that he had been silently nursing his hatred against me for some time. The attempt to compass my death was, after all, a very clumsy one, for he had taken no pains to hide his complicity in the matter, and would most assuredly have been charged with murder had it been successful.

I went to service the same morning. The Richies tried hard to persuade me to remain in bed; but as the Burton bells shook out their chimes over the tree-tops, we left the farmstead, and turning up past the old cottage where the

good Bishop Wilson was born, entered the family pew.

'Long was the good man's sermon, but it seemed not so to me.' Standing there among the village folk, we sang together from the little ivory-backed book, 'We praise Thee, O God. We acknowledge Thee to be the Lord;' and we lingered long on the way home through the wood where lie the lonely Quaker graves.

I found the 'young fellow' to be a Liverpool artist nearly as old as Abraham himself; and a very jolly wielder of the brush he was. It was for him that Abraham had made the early Sunday morning excursion, for, as 'Aba' explained in an apologetic kind of a way, 'Tha sees this young fellow's seen too much of the ways of farmyard ducks to have anything to do with them; so I just thought I'd get him one or two. Tha can hardly call it Sunday, tha knows, at that time in the morning.'

My adventure was not allowed to interfere with the sheep-washing arrangement, as it would somewhat have spoiled the plans of the artist, whose picture, entitled 'Washing Sheep on Burton Marsh,' has for some time been in the permanent collection of the Liverpool Art Gallery.

As for 'we two,' we are no longer divided by the Marsh.

A COLLECTION OF FANS.

WHO loves to ponder over tasteful and elegant trifles of bygone days of fashion, and to weave fanciful love romances whilst gazing on the dainty relics of the past, will delight in paying a visit to the Collection of Fans of Sir Matthew Digby Wyatt and Lady Wyatt at the South Kensington Museum. This collection includes specimens from most of the great fan-making nations of the world, and it is interesting to notice how the national character exhibits itself even in the design for so simple a thing as a fan.

The Oriental fans are rich in carving—carving that the European can only marvel at, and dare not try to imitate. The Spanish and Italian fans are both brilliant in colour; while the French are elegantly designed and painted, and often they have jewelled studs to fasten the sticks and guards together. Among the Oriental fans there are some Chinese fans of the finest sandal-wood, faultlessly carved. Others, of ivory, are pierced with figures of animals and birds, or minutely carved with a delicate lace pattern in fine open-work. One of them has the old story represented on the willow-pattern plate, exquisitely carved in ivory. There is the house and the island, the bridge and the three angry figures, the boat and the lovers, and the willow-tree with the two turtle-doves. Who knows, perhaps some almond-eyed Celestial maiden has trifled with this ivory plaything while her lover was kneeling at her feet and whispering a tale as soft as the tale of the two lovers in the story on her fan who eloped 'when the willow begins to shed its leaves.' Some of the fans have only the guards and sticks ivory; whilst on the body,

which is of fine silk, painted in most brilliant colours, are quaint groups of Chinese in wonderful costumes; and in the scrolled corners of the fan, under the blossoming almond and orange and peach trees, are beautiful specimens of fantastic and grotesque vases. Another fine specimen of Chinese art is a fan the body of which is made of the feathers of the argus pheasant, the sticks being of carved tortoiseshell. An old Japanese fan is painted on strips of wood with a delicate landscape, with herons and reeds in the foreground. A Japanese fan of the nineteenth century has the now well-known design of a lady-bird and beetle on the ivory guard.

Some of the German fans are very brilliant in colour, and have quite ambitious pictures painted on the small arc that stretches from guard to guard. There is one specimen of the seventeenth century that was purchased for twenty pounds, and represents Bacchus and Ariadne and bacchanalian groups. The subject is treated in a very masterly manner, and the whole fan is a work of art. Another German fan of about the end of the eighteenth century is made of chicken skin, and the subject painted on it is Venus and her doves, with the boy Cupid as her outrider, descending to a sleeping warrior who is guarded by Minerva with her shield and spear. One German fan of about 1760 represents the sale of Joseph by his brethren, and is somewhat pretentious, for a fan. In the foreground is a dark-looking circular hole, supposed to be a well, with a long end of rope dangling out of it and trailing along the ground. In the background wait a great number of camels and the attendants of a long caravan. Joseph is represented as a small boy in a blue blouse with a red sash around his waist, and wiping his streaming eyes with a large white handkerchief. Judah is holding up one finger to the band of Ishmaelites, who also are each holding up one finger; and thus, according to the artist, the bargain is concluded in dumb-show.

Some very pretty canal scenes form the subject of some of the Dutch fans. One specimen is very striking; the body of the fan is ivory, plain, and bound with green silk. The subject is a quaint Flemish scene by the side of a blue canal, with trawlers and old-world vessels. Another Dutch fan is made of horn stained saffron colour and ornamentally pierced. On many of these fans are miniature sea-views with sandbanks and sailors and fisher-boats, long belts of dark clouds and gray angry billows, such as Van de Velde loved to paint the Zuyder Zee; or quiet inland scenes with quaint old Flemish churches and gable-roofed houses by the side of placid canals, where the rising moon throws a mysterious blue glimmer over the trees and the reeds and the windmills and the sleeping hamlets—scenes that Van der Neer might have painted. Maybe rich burgo-masters' wives have dangled these toys at their wrists, and opened and shut them while they heard the news of the fate of John de Witt, or of De Ruyter's exploits in the Thames, or the tale of Van Tromp and the broom that he lashed to his masthead.

Very dainty are many of the French fans, and

great skill has been employed to give grace and delicacy to these toys, that beauty uses and makes beautiful; and the airy national fancy has ingeniously produced a harmonious *ensemble* in these magnificent trifles of art. Many of them represent pastorals and revels and masquerades and joyous scenes such as Watteau depicted with delicate colouring when he was 'Painter of Gallant Feasts to the King.' Gaily-attired shepherds are either playing on the lute or kneeling at the feet of their mistresses, who, with dainty ribboned crook and pink frock and blue bodice, are seated on green hillocks archly trifling with their adorners. These are the fans that fluttered to and fro in the old *salons*, and behind them played the eyes of the rulers of France. We can now only imagine the love-tales whispered behind these dainty screens of Cupids and Venuses, and the little court intrigues that were woven while the fan still fluttered to and fro.

Among the more modern French fans is a specimen made by Alexandre, and bought for sixty pounds. The guards and sticks are of carved ivory, by Brisevin; the body is fine silk, and is exquisitely painted with groups of figures in the costume of the period of Henri III. The mount of this fan is of delicate lace. Another by the same maker has the guards and sticks carved by Brisevin, with enamelled mountings by Lepec, the body of the fan being of pale sage-coloured silk. This was bought for eighty pounds. Many of the English fans are very delicate, and much talent has been spent in perfecting these gems of art. A prettily pierced ivory fan of the end of the eighteenth century is decorated with medallions containing a classical group of figures watching doves; the treatment is exquisite, and the colouring is in the style of Angelica Kauffmann, and may have been done by her.

Altogether the collection of Sir Matthew Digby Wyatt and Lady Wyatt is a rich one. Many of the Oriental fans date back to the time when the English were first planting their foot in India, and when the empire of the Great Mogul was tottering to its ruin. Perhaps they were once in the harem of Surajah Dowlah, or held in the jewelled hands of the Begums, or they may have been present at the receptions of Mrs Hastings in the Government House, Calcutta. Among the European fans there may be some that dangled from the wrist of those who saw Marie-Antoinette at Versailles, 'glittering like the morning-star, full of life and splendour and joy.' Who knows whether the fragile hands that held these painted trifles were not soon put up in supplication to the same cruel men who dragged away the unfortunate Queen of France? Or some there are, perhaps, that saw the gay ballroom at Brussels on that eventful night, the eve of Waterloo, when

Belgium's capital had gathered then
Her Beauty and her Chivalry, and bright
The lamps shone o'er fair women and brave men;

and above these very fans 'soft eyes looked love to eyes which spake again,' and fluttered the fan not more quickly than the little heart beat behind it. But who can tell us now of the brilliant scenes that have opened to these fans, and of the whispers and sighs that have been concealed in their folds? Alas! the actors and actresses in the play that was performed ever so many years ago

have played their little parts; they have smiled and sighed and bowed, and the curtain has come down upon them for ever! And who is there can tell us the life-history of one of their fans?

THE MONTH:

SCIENCE AND ARTS.

AN excellent paper 'On the Spontaneous Ignition of Coal' was read by Professor Lewes before the British Association at their recent meeting at Cardiff. In this paper the Professor points out that the common idea that spontaneous ignition is caused by the presence of iron pyrites in the coal cannot be true, because in many manufactures pyrites are largely used, and although stored in heaps and undergoing continuous oxidation, he has been unable to trace a single case of heating. Spontaneous combustion may be more truly traced to the absorptive power of newly-won coal for oxygen, an action which is accompanied by a great rise of temperature, and is naturally hastened if the coal be so stored on shipboard that a portion of it is near the funnel or boilers. Accidents from this cause are most numerous in ships which have to cross tropical seas, from the greatly increased temperature to which the coal is subjected. Ventilation in many ships is worse than useless, for it provides the coal with just sufficient oxygen to feed it when burning. Moisture is also an important factor in determining the ignition of stored coal. Professor Lewes says that if newly-won coal were stored for a month in moderate-sized heaps, so as to allow it to take up its oxygen and cool down after the heating caused in the process, spontaneous ignition would be almost unknown.

The incandescent electric light which is now becoming so common in our public buildings has a formidable rival in the improved Welsbach incandescent gas-light. This new method of burning gas was introduced from Germany about ten years ago; but, owing to certain defects, it did not meet with popular approval. All difficulties have now been surmounted, and the system is being introduced by the Incandescent Gas-light Company of Westminster. The lamp comprises a special form of Bunsen burner—which can be readily attached to any existing gas fitting—in the blue flame from which is supported a mantle of zirconia, one of the most refractory oxides known to chemistry. This mantle, which looks like a delicate finger-stall made of woven material, is brought under the intense heat of the flame into an incandescent state, and gives out a powerful and perfectly steady light of the same quality as that afforded by its electric rival. The gas consumed is considerably less than that used by the common bating burner, while the light is increased three or four fold. The lamp is also available with cheap gas made from benzoline and other hydro-carbons in the portable machines which are now in use in isolated districts where public gas-works are unknown.

Perhaps the most impudent form of adulteration is represented by the manufacture of artificial coffee-beans. Many a householder has prided himself upon being untouched by coffee adulteration by adopting the home-grinding system; but

his forethought does him little good if the beans supplied to him are mixed with those which owe their origin to burnt corn, molasses, &c., fashioned into form by means of a moulding-machine. We are glad to see that an imperial decree has been issued in Germany forbidding the manufacture and sale of such machines. It is said that a vast quantity of these artificial beans is sold in the United States, and that they are used for mixing with genuine coffee. There is a strong suspicion that the same evil practice is followed in Britain, for, as every one knows, it is extremely difficult to purchase a well-flavoured sample of coffee, even though the precaution be taken to roast and grind it at home.

All are familiar with the beautiful lacquer with which Japanese trays, boxes, and cabinets are treated, and which is so different in appearance and touch to the varnish common in Europe. The exact process by which it is prepared is said to be kept secret by the expert Japanese workers; but it is known that the raw material comes from a tree known to botanists as the 'Rhus vernix.' Professor Rein some years ago planted a number of these trees in the Botanical Garden at Frankfort, and there are now growing there from this stock several healthy trees, some of which are thirty feet high. Some sap has been taken from these trees and sent to Japan for trial by native artists, and it remains to be seen whether the foreign growth will yield a serviceable lacquer.

Samples of a new composition known as Liégine are exhibited at the Museum in the Royal Botanic Garden at Kew. This substance consists of powdered cork mixed with fine plaster in the proportion of ten per cent. The cork confers upon the plaster a solidity, durability, and above all a lightness which it does not possess when used alone, and the new composition can therefore be used for mouldings on thin partitions and ceilings without any danger of overweight. Liégine is also made into bricks; it can be used as a non-conducting coating for steam-pipes; and finds ready employment in various other ways. This new material is a very good illustration of the utilisation of a waste product; for it is obvious that the very smallest cuttings of cork can be used up in its manufacture. It may be added that the cork is reduced to powder by the action of horizontal grindstones.

The Refuse Disposal Company have established works at Chelsea (London), and have recently issued a circular in which they describe their manner of dealing with the product of metropolitan dust-bins. The company has already treated about six thousand tons of household refuse, separating the different items of the so-called dust from one another, and disposing of them to the best advantage. Thus, anything that can be reduced to fibrous pulp is manufactured into paper on the premises. The bones, bottles, fragments of china and glass, &c., are distributed among the various manufactures where such things can be utilised; the coke, coal, and cinders are also turned to profitable account; while the smaller ashes are made into block fuel. The vegetable and animal refuse is incorporated with fine dust and used for manure, or as an absorbent for dealing with offensive matter of any kind. All this work is carried on without prejudice to

the neighbourhood, for any odours or fine dust floating in the atmosphere are conveyed by exhaust fans to the furnaces of the establishment.

A new use for the Sand-blast has been found by the public authorities of New York in the cleansing of the exterior of a building there. The sand is conveyed through a pipe two and a half inches in diameter, terminating in a two-inch nozzle, and is projected on to the face of the stonework under an air-pressure of two pounds on the square inch. Under these conditions, one square foot of marble is abraded to the depth of thirty-second of an inch in one minute, leaving a fresh surface as pure and white as could be wished.

The use of terra-cotta as a building material is becoming common, some very fine erections being now to be seen in London and other cities, executed in this effective artificial stone. The basis of terra-cotta is clay, and the *Building News* recently gave some interesting particulars concerning many of the terra-cotta clays now employed. The finished material has such a smooth surface and close texture that it is eminently adapted for the dirty atmosphere of our towns. All these clays should be exposed to the air or weathered for some time before being used, for shrinkage is often very great and at the same time uncertain. The tint of the stone varies with the locality from which the clay is obtained. The buff colour of the new Natural History Museum at South Kensington is typical of the Tamworth clay; while the red façade of the Constitutional Club in the new highway which leads from Charing Cross to the Thames is identified with the Ruabon Clay.

A curious instance of the sagacity of a wild-duck is described by Mr Prentis, of Rainham, Kent, in a recent issue of the *Zoologist*. A field of lucerne situated near a marsh was being cut by a mowing-machine, which, after the manner of such implements, began work at the edge, and gradually reduced the area of the crop as it moved in ever-diminishing circles towards the centre of the field. When only about two acres were left uncut, a wild-bird was seen to rise from the field and to drop from her beak an egg, which upon examination proved to be about three parts incubated. A second and third time she returned to her nest in the lucerne, on both occasions carrying away an egg towards the marsh-land. The next day, when the mowing of the field was completed, the nest from which the bird had so thoughtfully removed the eggs was found.

A Chicago paper describes the successful trial of a new Automatic Magazine Rifle. The gas produced by the combustion of the first cartridge is stored in a chamber, where it acts upon a piston and spiral spring which actuate the mechanism of the rifle. By this means sufficient energy is found to extract the empty cartridge case, replace it by a loaded one, and to cock the gun. The operator has therefore merely to take aim and pull the trigger; and so rapidly does the automatic mechanism work, that the full complement of the magazine, which holds nine cartridges, can be discharged in two seconds. Such a rifle, we should think, will hardly conduce to accurate firing. Already, as is well known, there is a tendency in the heat of an engagement to fire away cartridges with so little attention to direction that only about one bullet in a hundred reaches its billet.

The Board of Trade Journal gives a very interesting account of the rapid development of asbestos-mining in Canada. Up to within quite recent years, the greater part of fine asbestos fibre suitable for spinning came from Italy and Corsica; but the trade has suffered a complete revolution since the discovery of vast quantities of the valuable mineral in the province of Quebec. In 1871 the Canadian mines yielded fifty tons of asbestos; last year, the output was eight thousand tons. The finer grades command almost as good a price as the best Italian; and although the quantity mined is so great, the material, owing to the various new applications which are constantly found for it, has not become any cheaper. The profits from the Canadian mines are simply fabulous, one mine alone yielding to its lucky owners an annual profit of one hundred thousand dollars. The work does not necessitate much excavation, for the asbestos is found in the surface-rock in the form of veins, and is obtained by blasting. The output is carefully regulated by the demand, and this is one potent reason why asbestos continues to keep up its price.

A new form of photographic lens has been designed by Mr Dallmeyer, the well-known London optician, which is likely to come into extensive use for a variety of purposes. Its novel feature is its wonderful power of giving large images of distant objects. For instance, with an ordinary photographic lens, the image of a horse or cow distant, say, two hundred feet from the camera would cover little more than a quarter of an inch, the actual size being of course governed by the focal length of the lens. But with the new objective, the image taken from precisely the same point would cover two or three inches. Such a lens will be of immense value in warfare in giving serviceable pictures of forts, outworks, &c., without the risk which would be incurred by a near approach to the enemy. It will also be valued by naturalists for the purpose of taking pictures of animals whose natural timidity forbids intimate relations. The lens is of simple construction, and it is quick enough in action to take a bird on the wing.

One of the latest triumphs in chemical science is represented by the production of artificial quinine. The new substance is absolutely identical with the natural product of the cinchona tree, and the discovery, which is due to MM. Grimaux and Arnaud of Paris, is likely to bring down the price of the valuable drug considerably. It is believed, too, that this manufacture may lead to the discovery of new bodies analogous to quinine which may have great therapeutical value.

Dr L. W. Fox, in the course of a recent lecture before the Franklin Institute of Philadelphia, stated that he had good reason to believe that savage races possess colour-perception to a far greater degree than do civilised nations. This assertion was based upon examinations which he had made of two hundred and fifty Indian children. Among one hundred of these (boys), he could not detect a single case of colour-blindness; but he felt certain that if these children had been whites and drawn from various parts of the United States, at least five of the hundred would have been colour-blind. As the result of an examination of Indian children made some

years previously, he had found two cases of colour-blindness among two hundred and fifty boys; while among the girls he could not detect a single case. This last result was as he expected; because even among white nations the percentage of cases of colour-blindness in females is as low as two per thousand.

An Italian paper publishes a method which, it is said, renders cement unattackable by frost, and which consists in adding to the material whilst it is in a plastic condition a solution of soda crystals in water. The cement experimented upon was composed thus: Portland cement and lime, of each one litre, three litres of river-sand mixed with a solution of one kilo. of soda and three litres water. The mortar thus made was first exposed for fourteen hours to a maximum cold of thirty-one degrees below zero, and was afterwards introduced for three hours into a furnace. Notwithstanding these crucial tests, the cement remained unaltered.

Mr Lawrence Allen, in a paper which he contributes to the American *Engineering Magazine*, contends that with all the attention which has been devoted to ventilation, there are many schools in which the quantity of fresh air is not sufficient to expel the foul air. For the maintenance of air in good sanitary condition each occupant of a room should receive sixty cubic feet of fresh air per minute, and very few schools come up to this requirement. There are many schools in the United States, says Mr Allen, in which the amount of fresh air admitted is about one-fifteenth of that really required. The children perhaps do not seem to suffer under this starvation system, just as those who inhabit unhealthy districts do not at once show signs of failing energies; but although the effects are not immediate and striking, the deadly influence is at work.

The science of warfare seems to consist of a constant struggle between methods of offence and defence. First comes the invention of a big gun which nothing will withstand, until a new form of armour-plate is devised, and the next gun must be made bigger and more powerful. When the Whitehead torpedo was first introduced, it was believed that ironclads had at last found their match. But a clever inventor proposed the use of a crinoline of steel network in which a ship could be enshrouded whilst at anchor, so that any torpedo aimed at the vessel could be caught in the meshes of the net and kept at a respectful distance. It is now reported, however, that Captain Vernon has contrived a scissors-like cutting implement which is fixed to the nose of the torpedo, and which will readily cut through the strongest wirework opposed to its path. So torpedo nets will now be obsolete, and some other means must be found to protect war-vessels.

The rain-making experiments which have lately been conducted in Texas have just that tinge of the supernatural about them which is sure to excite the interest and credulity of the average newspaper reader. In these experiments, charges of dynamite and other explosives have been discharged at great altitudes by means of mortars and kites, and we are told that these violent explosions have in nearly every case been followed by a copious downpour of rain. These experiments were suggested by the circumstance

that great battles have often been followed by rainfall, and there seems little doubt that if the atmosphere is in a favourable condition, a series of heavy concussions may induce rain. But it is a moot point whether rain, under such conditions, would not fall naturally without any artificial help. On the other hand, if the energy required for a fall of rain does not already exist in the moist air, no human power can put it there. If violent concussions of the air always induced rain, we could never rely upon a fine day for a great naval or military review; but it is well known that many such displays have been favoured by sunshine.

The project of making Paris an inland seaport has once more been brought prominently forward, possibly in view of the successful progress of our own Manchester Ship Canal; and a Committee appointed to report upon the scheme has finished its labours. The proposed water-way would be one hundred and fourteen miles long and twenty-one feet in depth, and the estimated cost of the works is six and a quarter millions sterling. From a plebiscite taken of the opinion of the people on the matter, it would seem that they are almost unanimously in favour of it. It remains to be seen whether, after their sad experience of the Panama scheme, they will be inclined to invest capital in an enterprise in which a canal figures.

THE STREET MUSICIAN ABROAD.

OF all capitals, London should stand highest in the estimation of the gentry who prefer to play rather than work for a living. Although supposed to move on and move off 'by special desire,' the London street musician is practically free to tickle uneducated ears and torture educated ones, when, where, and how he deems most conducive to the extraction of coin from the pockets of delighted or disgusted hearers.

Things are ordered very differently abroad. Street minstrels receive scant favour in Vienna. First of all, they must be licensed, and licenses are only obtainable by such persons as are able to show that no other method of earning money is open to them, and that the doors of the poorhouse are closed against them. Even when licensed, they cannot perform in the open thoroughfares of the city, but must content themselves with the harvest to be reaped in public-houses and courtyards, after mid-day on week-days, and between four o'clock and sunset on Sundays and holidays. In Berlin, licenses used to be issued at the discretion of the police authorities; but the recipients of the privilege were worse off than their Viennese brethren, being entitled to ply their vocation in courtyards only. So loud and long, however, were the complaints of unappreciative citizens, that in 1884 the fraternity were condemned to gradual extinction, it being ordained that no new licenses were to be granted.

In Rome and in Italian towns generally, street musicians and singers must register themselves as such every year, under a penalty of a hundred lire—about three pounds ten shillings—it being by law provided that 'registration may be denied to persons under eighteen years of age when they

are suitable for other professions,' to dangerous characters, and persons under police supervision. Registration is not necessary for members of bands ordinarily performing in public buildings when inclined to give their services out of doors at festivals, inaugurations, anniversaries, or other solemnities, providing they give due notice to the police authorities, who may, if they think fit, forbid them exercising their privilege.

Guitar-players are the only musical itinerants tolerated in the streets of Madrid; licenses to perform on the national instrument and ask for alms for so doing being granted or refused at the option of the mayor, who, as a rule, limits his favours to the blind, to enable them to earn sufficient to satisfy their modest wants. The organ or piano, as Spaniards call it, used to share the run of the streets with the guitar, the grinder paying twenty shillings a year for permission to turn the handle between the hours of seven and twelve, and four and seven; but even this allowance of organ music was voted an intolerable nuisance, and the instrument is no longer heard in Madrid. The organ-owners have petitioned the municipality to restore the old order of things; but Sir Clare Ford is of opinion that it is highly improbable that the mayor will accede to their request.

By an ordinance dated February 28, 1863, no itinerant mountebank, organ-grinder, musician, or singer can practise his calling in Paris without a license from the prefect of police, to obtain which he must satisfy that functionary that he is French-born, of good character, has dwelt twelve months within the prefect's jurisdiction, and is neither blind, one-armed, one-legged, crippled, deformed, nor infirm. He must supply a list of those accompanying him on his rounds, with full particulars about them, none of whom must be under the age of sixteen, or any more afflicted than himself. Every performer so licensed must wear a badge bearing his name and his number, and can only perform at the places specified on his license, between eight in the morning and nine at night in summer, and from eight to six in winter. Singers are forbidden to sing or sell any song that has not received the imprimatur of the Minister of the Interior. In 1881, street music received its quietus by the promulgation of a decree annulling the provision under which musicians were authorised to station themselves at particular points, and restricting such performances in the public thoroughfares to national fêtes-days. Paris is now, therefore, hardly a happier hunting-ground for the peripatetic entertainer than the Czar's capital, wherein no itinerant musician is allowed to sojourn. Whether his existence is tolerated outside St Petersburg we are not informed; if it be, native discourses of sweet sounds have nothing to fear from the competition of intrusive aliens, since itinerant players hailing from any foreign land are not suffered to cross the frontiers of the empire.

The United States is an awkward country for the roaming minstrel to travel. In one place he may revel in unlimited liberty; in the next, find himself mulcted heavily; in a third, liable to thirty days' imprisonment as a common fiddler and piper. A penalty ranging from five to twenty-five dollars awaits the vagrant, mendicant, or street musician playing any musical

instrument 'unsolicited' in the thoroughfares of Milwaukee; the carrying of any such instrument for the purpose of using it for gain is a misdemeanour in St Louis; in Philadelphia, street music has long since been prohibited as a public nuisance; while the cries of the privileged news-boys is the only 'noise to attract attention' to be heard in the streets of Chicago.

The strains of the barrel organ seem to be especially obnoxious to the people of Savannah and Brunswick, Georgia, Providence, Rhode Island, and the Empire City. In the first-named place the organ-grinder is called upon to pay five dollars a week, just as much as is exacted from a full band; in Brunswick, he alone of all instrumentalists must disburse a dollar a day; and he alone of all itinerant musicians is prohibited performing in Providence. As we read Consul-general Booker's Report, the organ-grinder is the sole object of the regulations regarding street music prevailing in New York, where the mayor has the power of licensing three hundred organs, to be used between nine A.M. and seven P.M. on week-days only—but not within five hundred feet of any hospital, public institution, or school-house in school-time; nor within half that distance of any dwelling-house whose occupant objects to its being brought nearer. For this license the organ owner pays one dollar per annum; and the player must not ask directly or indirectly for any money, under pain of paying ten dollars or 'going up' for as many days.

The license system is in many places extended to performers on other instruments. In Boston, a street musician's annual license costs him only fifty cents; in Jersey City, he pays five dollars; and in Newark, where he must bear a badge, double that amount. In Norfolk, Virginia, a dollar a day is exacted; while the strong feeling existing against the fraternity in Charleston has impelled the Committee of Ways and Means to impose a charge of fifteen dollars a day, a tax that has answered its end most effectually.

CONSTANCY.

ONCE more, love, we rest where the emerald sea
Breaks into music along the wild shore.

Is our rapture the same, love?—It filled you and me,
When we greeted the breeze and the billow before.
'Twas then—the white sails, and two hearts that leap,
Watching green hills from the crests of the deep.

Older a little, love, watching them flock—
Now ripples that kiss the old yellow sand there;
See how they laugh, where the weed-hanging rock
Pants for the wave in the quivering air!
Yes! How the tide swells—has the gleam of the gold
Crowning yon furze, made the sea overbold?

We do not forget those moments that gave
Joy to our hearts on the shore we love best:
Here, 'twixt the blue of God's sky and the wave,
Paradise bloomed to the mountainous crest—
Here, such a night! all the stars in the sky,
Two lovers whispered—'twas you, love, and I.

A SLEEPLESS NIGHT IN THE TROPICS.

A SLEEPLESS night is disagreeable anywhere, but especially so in the Tropics. Thus I thought as I lay twisting and turning on a fiery hot mattress, which seemed warm enough to form an alternative torment with the rack and other inquisitorial tortures. I was in the fourteenth parallel of north latitude, and the day before, the broiling sun had passed straight overhead and left every object frizzling under his perpendicular gaze. As I tossed about on my moist pillow, I reflected on these things, and could not help anathematising the cross-grained luck which had sent me to the fourteenth parallel of north latitude. This is rather a vague way of locating a place, however, and may include any region between Central America and the Philippines; but for the information of geographically inclined readers, I will add that my bed was traversed by the ninety-eighth degree east longitude. If any one should take the trouble to look up in the map of the world where these two lines cross each other, it will be found that this inquisitorial bed of mine is situated in an out-of-the-way corner of South-eastern Asia, in Siam, otherwise called the Land of the White Elephant.

It was the month of April, when in temperate climes the 'young man's fancy lightly turns to thoughts of love;' but here our fancy is turned to ices, cold baths, and other cooling means, for April is the hottest month in the year. This night, I would have given a kingdom, if I had possessed it, for a piece of ice. I had read somewhere that an unfailing means to procure sleep is to bind two pieces of ice tightly over the eyes; but of course one does not think of going to bed with two pieces of ice in anticipation of a sleepless night. I tried, however, a good many other dodges, such as going through the Greek alphabet—which in my school-boy days would have been crowned with immediate success—counting slowly up to a thousand, keeping my mental eye fixed on some stationary object—but all in vain.

Fickle Dame Sleep was not to be courted, and with a muttered anathema I turned to speculate on the causes of my sleeplessness.

Was it the heat? No; I thought not, for I used to sleep peacefully through hotter nights than that—nights which drenched my *pyjamas* with perspiration, and left me in the morning wet as if stranded a shipwrecked sailor on the surf-beaten shore. Was it those prawns with which my Chinese cook had flavoured the burning curry I had taken at dinner? Or was it that post-prandial cup of fragrant Mocha which I had sipped with such enjoyment, while building gay airy castles in the curling smoke of my Havanas? Was it not that game of billiards, under the blazing lamps, in a temperature close upon one hundred degrees Fahrenheit, followed by two buckets—glasses, I cannot call our tropical drinking-measures—of heavy lemon squash? I sadly came to the conclusion that the last bucket of lemon squash had been too much for me.

We are strange creatures, we European residents in Siam. Not content with heat during the day sufficient to roast the proverbial ox, we must make night unendurable in the close stuffy atmosphere of the Club billiard-room, and then attempt to 'damp' ourselves down with innumerable iced drinks, ruinous alike to pocket and digestion. It seems incongruous to think of a commonplace lemon squash causing insomnia in the heart of Indo-China. One would prefer it to be 'a fierce encounter with a white elephant,' 'a desperate tiger-hunt,' 'a hairbreadth escape from a deadly cobra,' or some other strange adventure which would look well from a literary point of view. It mattered little to me, however, whether it was 'a hairbreadth escape' or only a lemon-squash, for sleep I could not.

Not a breath of air moved the close atmosphere; and my surrounding canopy of mosquito-netting seemed to render it all the more suffocating. We don't trouble with many bed-clothes in the Tropics. Blankets there were none, and my sleeping apparel consisted of a 'sarong' or piece of cotton cloth about the loins. I now

gave up all attempts to sleep, and allowed one vague fancy after another to course through my brain, unhindered by Greek alphabets or numerical calculations. My Dutch wife I rudely tossed aside—start not, gentle reader, a Dutch wife is not a creature of flesh and blood, but only an inanimate bolster for resting the knees upon—and spent the next quarter of an hour in vain endeavours to slaughter a buzzing mosquito which had passed the barrier of my net. Trying to kill a mosquito is very disappointing work. I would hear him swooping down with a fiendish booming. I prepared to launch a terrible stroke at him, and when he landed on the tip of my ear or the point of my nose, I would nearly knock my head off with the violence of my open-handed blow. I felt sure that his blood—or mine rather—was trickling slowly down my face; but in another minute I would again hear his infernal buzzing; and thus the exasperating little tragedy would be repeated *ad infinitum*.

Tired of these blood-thirsty manœuvres, in which I always came off second best, I got up, and had recourse to my bathroom. 'If I can't sleep,' I soliloquised, 'I'll at least be cool and free from mosquitoes.' My bath-room is simply a part of the veranda laid with zinc, and contains a large tub of water as furniture. I lit the lamp, and calmly sat down in the tub, with the water up to my neck and a lighted cheroot in my mouth. The water was quite warm, and must have been at least about eighty-five degrees Fahrenheit. I thoroughly enjoyed this midnight bath, and hoped that the temperature of my seething brain would be somewhat reduced thereby. My cheroot finished, and feeling just a trifle chilly, I hastily rubbed myself down and got back to bed.

To my great exultation, I succeeded in killing my mortal enemy the mosquito by a first lucky stroke; but no sooner was I settling into a delightful doze, than piercing screams disturbed the peaceful midnight air. 'My old friends the cats,' I groaned.

Siamese cats are justly famous for their beauty, grace, and amiability, and for these reasons some people are anxious to have the race preserved in all its pristine strength. They are also notorious for the most horrible caterwauling; and I am strongly of the opinion that for this reason alone they ought to be mercilessly exterminated. Caterwauling may be heard in other parts of the world, but it is not cultivated till it becomes an exquisite art of nightly torture as it is in Siam. Here the passions are excited to a degree unknown in colder climates, and expression is given to them with an undescrivable intensity and fervour. There is a shady grove of bananas just underneath my bedroom window, and there all the feline Romeos and Juliets of the neighbourhood—and they are not a few—are accustomed to come and pour into each other's ears their undying tale of love. They were having a

special performance this night, to judge from the unearthly groans, squeaks, and yells. I waited some time, in the vain hope that they would move on and give their charming serenade elsewhere; but I was reluctantly forced to get up. Three pairs of boots and slippers did I hurl in quick succession, crashing through the giant leaves of the bananas, and then silence was restored. I soon discovered that my troubles were only beginning.

If cats are a nuisance in Siam, the dogs are worse than any Egyptian plague. Imagine a huge Oriental city swarming with hosts of homeless dogs continually on the move, snarling and barking and making night hideous. The tenets of the Buddhist religion forbid the pious Siamese from killing these brutes, and they multiply and replenish the earth to an alarming extent. The theories of Malthus here find among the dogs a striking verification. Were the means of subsistence to increase as rapidly as the dogs, they would soon be as innumerable as the sands on the sea-shore; but it is a blessing that most of them die of sheer starvation. Those that do survive this terrible struggle for food are fierce and gaunt to a degree, while they have a bark as hoarse and horrible as we can imagine the bark of Cerberus to have been.

As I lay still slowly repeating the Greek alphabet, one of these wretches lifted his voice, and immediately the chorus was taken up by wandering brutes like himself, and by those that act as faithful watchdogs. The waves of sound went widening out as do the ripples on a pond when a stone is dropped into its still depths, till I thought the whole city must rise up in wrath and slaughter every dog. At last the panic died away from utter weariness, and nothing could be heard but one persistent yelping cur stationed not fifty yards from my own door. He held on with a constancy worthy of a nobler cause, and was answered by a faint distant 'bow-wow' at least two miles away on the other side of the river. This melodious duet was kept up till I was nearly lulled to sleep by its unvarying monotony; but such luck was not to be mine, apparently.

There was yet a third plague in store for me—the plague of crowing cocks; and only those who have resided in Bangkok and are troubled with insomnia can form any idea of it. When I was a hard student in the London suburbs, I made a special agreement with my landlady that she was not to keep cocks and hens, and that if any of her neighbours should do so within a radius of half a mile, I would immediately quit my rooms. Unfortunately, no such arrangements can be made here. It would bankrupt a Cæsar to buy up all the cocks within a radius of one hundred yards. A love of cock-fighting is one of the strongest Siamese passions. Everybody keeps a fighting-cock, pets, pampers, and caresses it as fondly as does an old maiden lady at home her

favourite spaniel. My cook has one. My 'boy' and my coolie each has one, and there are terrible battles behind the house occasionally.

The clock was just striking one when my boy's cock crowed. His two rivals immediately responded, and again another wave of sound went rippling over the city. Defiance rose in every shrill 'cock-a-doodle-doo.' Defiance was hurled from one side of the river to the other. Defiance shrieked itself hoarse for miles around.

I got up in despair, and looked out over the veranda. The moon was rising pale and radiant, and threw a silvery glimmer on the ghost-like palms and the spires of the fantastic pagodas which rose in the distance. The faintest suspicion of a breeze was now rustling through the gigantic arms of the spreading bamboo that overshadowed the house. I sat on the veranda in my airy costume, and had some satisfaction in gazing dreamily upon the mild beauty of the night. The delightful scent of the 'Queen of the Night,' a white flower which sheds its perfume only in the darkness, filled the atmosphere with its luxurious odour. The neighbouring green-painted château seemed in this flood of romantic moonlight more the creation of some genii of the *Arabian Nights* than the abode of simple John Johnston the rice-merchant. I was new to the Tropics, and still revelled in the entrancing beauty of a moonlight night. There was no cessation of noise, however. The cicadas chirped as loud as birds, huge beetles droned their lazy onward path, and the whole air throbbed and boomed with invisible creatures.

The loud sound of something overhead shouting 'Tookay! tookay!' aroused me from my reverie, and as I looked up I saw the crocodile-like form of the tookay, as is its onomatopoeic name—a reptile of the lizard tribe, about a foot long, and of a dark colour. This tookay was not unknown to me. He had often startled me before with his peculiar cry, and I had made many endeavours to catch him with a noose at the end of a bamboo stick, as he scampered along the walls. I was in hopes that he might call out thirteen times, for this is reckoned particularly lucky for the listener; but at the close of eight calls he finished up with a funny grunt—a chuckle of the greatest satisfaction, I should think, of having disturbed as many people as he could.

Another eerie sound fell upon my ear, the cry of some benighted cake-seller in her canoe upon the river. Poor old woman! her tale of little sugar-cakes was yet unsold, and this being the evening of a native festival, she was still making the echoes ring with her quavering falsetto voice. Not so pleasant was the sound of the drunken revelry of a party of European sailors as they rattled past in a 'gharry' or native cab on their way to their floating home, a long way down the river.

Finding sleep impossible, I lit my lamp again and whiled away some time by penning the above narration of a few of the inflictions which a sleepless night in the Tropics incurs.

I feel dreadfully sleepy now. I hope the reader does not. However, I am off to bed for

the third time; and Siamese cats, dogs, and cocks may do their worst, for I am sure that ten o'clock in the morning will still find me wrapped in profound slumber.

A SOLDIER AND A GENTLEMAN.*

Author of *The Cure of Souls, Tinted Vapours,*
Master of His Fate, &c.

CHAPTER XII.—THEY TWO.

FERRERS was out of bed very early; for he had slept little and had little mind for sleep. He drew up his blind, opened his window, and looked out over the lovely sunlit landscape. Its beauty went to his heart, but only to darken by contrast his secret wretchedness. But his way was clear, and he would take it without turning to the right hand or to the left. Meantime, he resolved to dress and go out.

It struck five by the clock in the stable tower as he left the house and walked away through the grounds. He did not linger in the garden, but struck across the park, where the cattle raised their heads from their early grazing to stare at him. He discovered soon that he was not the only early riser. As he climbed over a hillock in his course he noticed some little way off two men disappear into a clump of holly-trees and brushwood, at the end of the larch plantation. Something in the set and gait of one of the figures made him think of his midnight visitor. He did not particularly wish to meet and converse with him again; but he was curious to see what he was out for. The clump into which Dawlish and his companion—probably his 'man'—had vanished was continued in the plantation across Ferrers' line of route, and to its nearest point Ferrers made at a sharp pace.

When he reached it he saw a little way off a hollow glade—somewhat like a spoon at the end of its handle—and in the glade the two men with their coats off and with their shirt sleeves rolled up. With interest quickened into alarm he slipped nearer, and saw that the men were preparing to box with gloves, and was satisfied. He lingered, however, to witness a round or two, and to hear the one (young Dawlish) say, 'That's enough for a morning breather,' and the other reply, 'No, no, sorr; that isn't enough. Up wid your mauleys;' and then he withdrew, and returned towards the house.

He was within the enclosure of the garden proper when he saw another early riser still, who made him hesitate, and feel as if he would like to hide or run away. It was Dolly in a morning robe of white, and with a red parasol to shade her from the sun. The burden of the confession he had to make was as lead in his heart and on his feet; but he was drawn on in spite of himself, for he knew she had seen him, and when her bright look was bent on him, to her he must always turn. He did not know what he meant to do or to say; he only felt that he must present himself to her, lay himself and his deceits bare to her, and let her judge him.

He was approaching her, and she was waiting for him with a smile, when down one of the

[* Copyright reserved in the United States of America.]

gravel walks trotted Aunt Dawlish in a great straw hat. 'Dolly dear,' she called, 'you must be getting your feet wet on the dewy grass.'

'I'm not, aunt,' said Dolly. 'What a fidget you are! But, to please you, I'll stand on the gravel.'

'You'd better come in, my dear,' said Aunt Dawlish, now close to her; 'it's much too early for you to be out. You'll quite spoil your complexion with these absurd country ideas. Besides,' she continued, taking her arm and whispering in her ear—

Whatever it was that Aunt Dawlish said in her ear, it made her blush divinely.

'Adieu, cousin,' said she, 'for the present;' and she departed into the house.

He hung about the garden till he was weary; he saw Drew come out—this day with Drumly—after an early breakfast, and depart again in a wagonette to take the train to town; he kept out of the way, for he did not wish to talk with the bankers then, and by-and-by he heard the breakfast-bell ring, and went in. He was unavoidably somewhat cold and distant in his 'Good-morning' to Sir William; nor was he very good company at table. Now and again he found Dolly's eyes wistfully fixed on him, and his heart was wrung with grief and dismay at what was about to happen. Yet he was resolved to take the first opportunity to bring things to an issue.

It did not seem as if there would be much difficulty in arranging a private interview between himself and Dolly; for there was no excursion, Debrett being gone for the day, and Drew and Drumly on a visit to town—on the business of the projected marriage doubtless. Yet it was long before he could encounter her alone, Aunt Dawlish kept such dragon-guard over her. At length in desperation he resolved to do as she had once done herself when she desired an interview.

'I want,' he wrote on a slip of paper, 'to talk with you alone very particularly. The Picture Gallery won't do. Meet me in an hour in the hollow in the larch plantation.' He rolled the paper up into a tiny cylinder, and watching his opportunity as he sauntered by, he dropped it into Dolly's lap as she sat reading on a shady bench in the company of Aunt Dawlish and Mrs. Drew. That done, he moved away, and by a roundabout route made for the plantation. At the end of about half an hour he was in the hollow glade where he had seen young Dawlish and his 'man' sparring in the early morning. He had quite half an hour to wait, and, to consume the time and allay his restlessness and the foolish flutters that invaded even his great chest, he set himself to cut and shape a holly-stick.

At last he heard the rustle of a footstep, and his heart leaped within him, less—alas!—with joy, than with grief and pain. She came—his own, his sweet!—to whom he could never tell how sweet and dear she was. He went with slow steps to meet her, trying the strength of his stick as he went, trying it so that he snapped it. But it did not break clean; it was green and tough, and the lacerated fibres still held together.

'I wonder,' he thought, 'if that is how this parting is going to be!'

When they met, she looked open-eyed and dis-

turbed. 'What is the matter?' she asked. 'I see there is something. There seems to be something the matter with every one to-day. I saw a strange man cross the end of the garden this morning. I told Aunt Dawlish, and said what he was like, and she looked fit to drop with fright, and begged me not to speak about it. The curious thing is that I feel as if I ought to know him.'

'What was he like?' asked Ferrers, with a sure expectation of the answer.

'He was as tall as you, but narrow all about here'—indicating her own chest—'and pinched, as if he had grown up in a tight place; and he looked at me, and smiled, and bowed like an idiot, till a man that was with him took him by the arm, and led him away. I wish I could think who he is.'

'Miss Dawlish,' said Ferrers, nerving himself to open the great exposure, 'that is the very thing I asked you here to tell you about. That man you saw is your cousin, *William Dawlish*: I am not.'

She gazed at him a moment with wide-open, startled eyes. Then she shrank back a step, and put up her hands to her face, as if she would hide herself. Her feeling was clear. She was ashamed through all her nature that she had been frank, and even bold—as the world counts boldness—with a man who proved to be an utter stranger!

'Oh!' she cried. 'What dreadful thing is this?'

'I am afraid,' said Ferrers, 'I have done you great wrong; but you may be sure I never meant it.'

'Who are you, then?' she asked.

'My name,' said he, 'is George Ferrers.'

'But what are you?'

'I am nothing,' said he, with proud resolve to strip himself bare of quality. 'I have been a soldier.'

'And you are an artist, I suppose,' said she, with who knows what quick, instinctive desire to see him retain some quality or function with which she had believed him invested.

'I am something of an artist,' said he.

'And is that why there are the initials "G. F." on your pictures?'

'Yes; that's why.'

'But why—oh, why—have you come about me and told lies, and pretended you were my cousin? You had some reason for doing it, I suppose? Why have you behaved to me as you have, and made me behave to you?'

'I have not told lies,' Ferrers had a mind to say; but he perceived that would be but paltering with words, since he could not deny he had been acting lies to her.

'I was introduced to your uncle, Sir William,' said he, 'and he asked me to take the name of William Dawlish.'

'My uncle knows of this, then?' she asked.

'Yes,' said he. 'I would have told you before—the day after we came here—but he said you knew.'

'He said I knew? And you believed him?'

'I was fool enough to take his word as a gentleman, and I didn't know what to think.'

'And my aunt?—does she know, too?'

'Yes; she does, too.'

'Oh! Dreadful! And what has it been done for? Surely, not for a joke?'

'I began it,' said Ferrers, 'as a joke; but I have found that it is very serious; and that is why—partly why—I have determined to tell you the truth as I have discovered it. Your uncle wants you to marry his son, your cousin, and he was afraid your trustees would not agree to the marriage, if they knew and saw his son.'

'Why?'

'Because he is not man enough to marry,' said Ferrers desperately; 'because he is weak in body and in mind—because he is an imbecile.'

'And my uncle asked you,' said she with scorn, 'to appear as the necessary person, because you are not an imbecile? He put you forward in the part, and you played it. You came and smiled and danced with me, and talked confidential lies to me in the most cousinly way! I must congratulate you on the finish you gave to your part. Perhaps you had played it often before?'

'Never!—never!' said Ferrers, with the air of a patient, strong man protesting against the wantonness of blows showered on him.

'And how were you to be rewarded, may I ask, for the playing of your part?—your part of stalking-horse to my uncle's son?'

'I was to receive a sum of money,' answered Ferrers.

'Money?' she exclaimed. 'You engaged to smile and dance with me, and to talk to me, and walk with me, and sketch with me for money? Oh, how miserable, how mean, how shameful!'

'Hear me,' pleaded Ferrers. 'You don't understand. When I met Sir William, and he proposed this to me, I was very poor—I had scarcely any money at all—scarcely any. You might not believe me if I told you how little. I was glad to get the chance of occupation and money, and I promised to do what was asked of me, without knowing or guessing what I would be asked to do. If I had imagined I was going to bring trouble or grief to you, I would have died rather!'

'And why do you think you have brought trouble and grief, as you say, to me? I have no doubt that to-morrow or the next day I shall look back on it as a very curious and original joke.'

He said no word, though his heart was bursting; but he could not refrain from turning on her, eyes as simply appealing as those of a dumb animal.

'Oh, man, man!' she cried, 'have you not a word to say for yourself?—not a word?' She put her hands to her face, and sank on the ground in a fit of weeping, while Ferrers, longing to go to her aid and yet not daring, stood with clenched hands and heaving chest.

'No; I've not a word!' he murmured blindly to himself. 'Not a word shall I say!—not a word! It serves me right! It serves me right!'

'And why,' she asked, after a pause, 'have you kept this so long?—or, rather, having kept it so long, why have you not kept it longer?'

'Because,' said he, 'as I have told you, Sir William deceived me, and because I have just discovered the truth. I knew last night for the first time that there really is a cousin whom you are intended to marry; and last night I saw him—saw that he is a creature no woman, least of all you, ought to marry.'

'And why not? It is surely not for you to say whom I am, or am not, to marry!'

'No,' said Ferrers; 'it is not for me to say; but I hope you will not marry him. It would be better for you to be dead than married to him!'

'You are a very presuming person to say that to me! A complete stranger to express such an opinion of my own cousin!—one of my own family! I remember my cousin very well; and I liked him. He may not be so big and strong a creature as you are, but I'm glad, yes, glad he is not. And if my uncle wishes it, and he wishes it, I shall marry him, whatever any one may say.'

'Call me what names you like; I deserve the unkindest and cruellest things you can say to me; but do not let yourself be deceived and hurried into a marriage with that man! And you may be deceived and hurried before you are aware.'

'I am quite able to take care of myself; I am mistress of my own actions; and I beg you will not give me any more of your advice.'

'If you will not save yourself by my advice, then I must save you in spite of yourself. I do not wish to interfere any more in your family matters, and make a fuss; but if you persist in going through with this mad business, I must!'

'Go away! I will not hear you any more. I will not talk to you any more. Go away! And I hope I shall never see your face again. Go away!'

He stood a moment with hands outspread, with bursting heart, and swaying form. Then, 'Yes,' he murmured—'yes; I'll go away—I'll go away!' So he turned and walked out of the hollow, while she watched him, with her hands tight clasped upon her panting bosom. But he did not look back; did not show a hint of hesitation to obey her command to go away and let his face be seen no more. He walked on, steadily on, down the narrow vista of larches, and disappeared.

He felt beaten sore by the hands that he loved, all the sorer that those hands seemed pitiless. All his world was tumbled about his ears—life and love, hopes and fears, desires and ambitions—and he stumbled blindly on out of the cool shade of the wood into the blazing sunlight of the park. Why had she been so hard with him—so terribly hard? Yet he loved her!—loved her all the more distractingly for the pain she had given him! And how she had smitten and scourged him with her words! She had shown a strength of feeling, an intensity of passion of which he had not thought her possessed. It was all over now—all over between them! (she had begged that she might not see his face again!) but still he admired her all the more for that last meeting. There was, however, a wild sense of rage and revolt gathering in his heart, which found no vent, and which was the more dangerous and reckless because of the shielding tenderness with which he must still regard Dolly.

Crossing the park, he spied Sir William, and at once his feeling of rebellion and rage rose to find its issue. He turned out of his course and strode towards him. Sir William waited for him.

'Well?' he cried genially from a little way

off. But when he saw Ferrers' pale, set face, he was on his guard. 'Halloa!' he said. 'Is something gone wrong?'

'Everything's gone wrong!' said Ferrers. 'But I shall not waste words on you. You have used me for your own mean purposes, and I hate you. You have lied to me, as one man should not lie to another without suffering for it in his carcase. I do not want to hear another word from your mouth; I have heard too many. I overheard all your talk last night with your sister; I had a pleasant visit from your son in the night; and now I just come from telling your niece all I know.'

'The devil!' exclaimed Sir William.

'Yes,' said Ferrers; 'I wish I could be as strong and merciless as the devil with you!'

'Ha!' sneered Sir William. 'Now, I suppose, that your business is done in your own way, you want your money.'

'I want none of your dirty money,' said Ferrers, laying a firm grip on the baronet's shoulder—a grip which he wriggled to be rid of, but which held him effectually, 'nor any more of your insolence. You'd better go and attend to your niece up there; and mark this: if with your deceit or persuasion, or anyhow, you get her married to that idiot son of yours, I'll wring your wicked, lying old neck. You understand?' And he gripped the shoulder painfully; but Sir William did not wince, nor put off his careless manner.

'That would be murder,' said he, with one of his old grins.

'It may be,' said Ferrers, 'for all I care; and it will be, if you neglect what I have said.' So saying, he let Sir William go, and strode on towards the house.

CONCERNING ETCHING.

THOUGH, doubtless, there are many people who understand what is meant by 'Etching' and what the process is, we have met a considerable number who by their remarks have proved conclusively to us either that they have no ideas at all about it, or that the few ideas they have are very vague and uncertain. It is for this reason that we intend to explain as shortly and as clearly as possible what is really meant by 'etching' and how it is done.

We remember on one occasion calling upon a lady, when, owing to some remark of ours about a picture which was hanging opposite to us, our conversation turned upon this subject, and our hostess told us that she admired this branch of art immensely. After having shown us the small collection which she had made, in which we discovered some little bits very cleverly and prettily executed, she told us that her son had a taste for drawing, and that lately he had turned his attention to etching with some fair success. As we take a great interest in this pursuit, we expressed a wish that we might be allowed to see some of his results. After a few minutes' absence our hostess returned with her son's handiwork. Yes; they were very neat effective

little bits, done with a delicate freedom of style; and on the whole they were fair specimens of—pen-and-ink sketches, but not etchings at all.

On many other occasions we have been similarly misled, and often disappointed for the same reason; and have more than once been asked to explain what 'real etching' is.

In the first place, the very sound of the word 'etch,' which is derived from the German *ätzen*, suggests to us our word 'eat;' and in this lies the true art of etching. An etched line is a line eaten into a plate by the action of some acid which will decompose the plate. A pen-and-ink line is not an eaten line, and therefore not an etched one, and for this reason a pen-and-ink drawing is not an etching. The proof or print which we see of this work is really an 'impression' only, the etching, properly speaking, being on the plate itself; but since without the work on the plate, such impressions as these could not be produced, and without these impressions the beauty and accuracy of the execution could not be gauged, and the whole art would be useless, it is customary to call these impressions 'etchings.'

The following sketch of the process is quite a rough one, for we should not have space to enter minutely into details, nor, indeed, by so doing should we be fulfilling our original intention, which was merely to explain the art of etching sufficiently to prevent further misunderstandings.

The plate upon which the etching is worked has one side—that upon which the work is to be done—perfectly smooth and even, and without the minutest flaw. It is usually made of copper, but sometimes of zinc. Iron and steel, too, have been used; but the results are not good. The preparation of the plate is the work of the copper-smith, and requires great delicacy and care; but some etchers do even this part of the process for themselves.

Having got his plate ready for use, the etcher then proceeds to cover it on the working side with a waxy substance which is called 'ground.' The instrument with which he transfers his design on to the plate when the ground is laid is a needle of steel driven into a wooden handle. But in working the design on to the plate the etcher does not make any mark on the plate itself, for he simply traces it in the 'ground,' the point of the needle forming a line by scraping away the ground as it moves along. This ground must therefore fulfil the following conditions: It must resist the action of the acid into which the plate is to be subsequently immersed. It must adhere firmly to the plate. It must be of such a nature as to come away on the touch of the needle-point in a clear line without breaking up on either side.

This ground is formed by mixing up waxes, gums, and resins in different combinations. There are several ways of laying it on the plate. It can be done either by melting it and dabbing it over the plate by means of a pad made of horse-hair tied up in silk; or by dissolving it in oil of lavender and rolling it on with a small roller; or else by dissolving it in chloroform and pouring it on to the plate, letting it run all over quickly, and draining off what is superfluous at one corner. The ground when laid forms a very

thin even coating over the whole working surface of the plate.

The ground being laid, there is yet another process before the plate is ready to take the design. The plate is heated so as to melt the ground, and it is then blackened by holding it face downwards over a gas jet; the smoke of the flame mixes with the melted ground, so that, when cool again, it presents a black shining surface. The object of this is to aid the etcher when he works his sketch on to the plate, for, as he draws each line in the ground with the needle-point, it shows up a beautiful copper line against the black of the ground.

There is one very important point to bear in mind when working a design on to the plate—that is, the sketch in the proof will come out reversed to that which is drawn on the plate. Therefore, if it is desired to be a true and not merely a pretty picture, the sketch must be drawn on the plate the reverse to what appears in nature. This may be done by using a looking-glass, or by making the sketch on a piece of paper with a soft pencil, and then damping it and turning it pencil-side down on to the ground, and pass it through a press. Of course, in the latter case the drawing appears on the plate in gray lines on the black; these lines have to be gone over with the needle in order to lay bare the copper.

When the design is completed on the plate, it is ready for the bath. The bath consists of a solution of nitric acid or some other similar mordant. The only parts of the plate upon which this can act are the lines drawn by the etcher's needle, where the ground has been removed; all the rest of the plate is protected on the face by the ground, and on the back and edges by a black varnish which is laid on for this purpose. So long as the plate remains in the acid, these lines are eaten deeper and deeper into the plate. The deeper the line is eaten into the plate the darker it will appear in the impression; therefore those lines which are required to show faintly must not be sunk deep into the plate—that is, must not be eaten long by the acid. Thus, when the plate has remained a little while in the bath, it is taken out, and the places which are wanted to print faintly are 'stopped-out.' By 'stopping-out' is meant that these places are covered over with some varnish, to prevent the acid from acting upon them any more. When this has been done the plate is returned to the bath again, and this process is repeated until the darkest lines of all have been sufficiently eaten in.

Now the plate is washed in water, and the ground and varnish removed with turpentine, when it is ready for the printer. The printer having received the plate and selected his ink—a thick and greasy substance—proceeds to warm the plate and then fill in the ink by means of a dabber. When he has satisfactorily done this, the ink is wiped off the edges and the plate is laid in the press; the paper is slightly damped and laid on the plate; the blankets are pulled over it, and it goes through the press. Impressions from an etched plate are of two kinds—proofs and prints. The proofs are the earliest impressions and of a certain number. These are signed by the artist, whereas prints are not signed.

There are perhaps few pursuits which raise more interest and excitement than etching does. During the process of execution, the artist conjures up in his mind the picture as he expects to find it in the impression; he is as it were working in the dark. In the case of beginners, there is a grave doubt as to whether the result will be at all presentable, for the difference between what he expects and what he finds to be the result is often astounding. As for the experienced hand, though he knows almost exactly what his proof will be like, he cannot tell whether the general effect will be just what he expects and intends.

DEAREST IS DEAREST.

By T. PRESTON BATTERSBY.

IN THREE CHAPTERS.—CHAP. I.

A SHORT November afternoon was drawing near to its close. Winter had not yet fully set in in Ireland, and the air was still mild; but a thick damp mist hung over the river Inny and the low-lying meadows around, and rolled in dense masses up the old coach-road and through the village of Ballinalack. Every leafless twig in the hedges condensed it, and was loaded with drops of water, which dripped steadily on the wet grass as they became large enough to fall by their own weight, for there was not wind enough to disturb them. The thatched roofs with their mossy coverings were great sponges of moisture; and the ducks splashed about gaily in the puddles, rejoiced that they could find plenty of water for their ablutions without taking the trouble to waddle down to the river. In fact, it was a day on which an Englishman would have vituperated the weather heartily and retired to read a novel in front of a cheerful fire.

But to the damp-inured natives of Ballinalack it was no more than a 'fine soft day—thank the Lord!' A few of them even took the trouble to put on their gray frieze overcoats. The village street was full of them; the men leaning their backs against any convenient wall, and smoking their clay pipes in passive enjoyment of that *dolce far niente* which they can appreciate as much as any Italian of the sunny South; the women gossiping, running into and out of each other's houses, scolding and smacking the dirty children who were playing in the puddles, and altogether having a busy time of it. The public-houses—of which there seemed to be at least one for every private house in the village—were doing a good business, as they generally did. As for the fact that there was not a respectable dwelling in the place, or a clean spot to rest the eye upon, or a window without a broken pane in it, no one remarked that, or, had they remarked it, would have cared in the least that it should be so. They were perfectly satisfied with the order of things, and no reformer had come that way to make them discontented.

There was, however, on this particular afternoon, a lack of material for conversation, of which they were dimly conscious. No one had sold a horse lately, or lost a cow in a 'gripe,' or been sent to jail; nor had even the river amused them that summer by flooding their hayfields, and so postponing the season of haymaking to

some indefinite time before Christmas. The Inn Drainage had changed all that. It was a perfect godsend when the wheels of a car were heard accompanied by the footsteps of a fast-trotting horse, and it became evident that some one was about to pass through the village.

The car came at last—a smart, well-painted vehicle, with one footboard turned up to serve as a shelter for the seat on that side. A fine thoroughbred mare was in the shafts, and it was driven by a young man of thirty or thereabouts, who wore a brown cap with ear-flaps, and an immense ulster with a heavy cape. Several of the loungers touched their hats to him as he drove rapidly past, and he acknowledged the salutation by a slight movement of his hand, but without looking up, or attempting to moderate the speed at which he drove, though ducks flew, and hens screeched, and mothers snatched their children out of the way. In a minute or two he had passed the village and was well on his way towards Bunbrosna. Then broke forth a volley of ejaculations and gossip.

‘Musha, then, Master Charles is in a hurry this fine day,’ said one stalwart man as he wiped the mud off his coat with a wisp of hay. ‘Sorra much he cares for the likes of us. Look at me new coat, that I bought in Edgeworthstown last January; sure, he’s destroyed it entirely!’

‘What harm if he did?’ remarked a woman. ‘You can well afford to buy another, Tim Higgins! And why wouldn’t he be in a hurry when Biddy Moran says the old man is mortal bad and his reverence wanted at once?’

‘Whew!’ said another man, with a long whistle. ‘That’s the way of it, is it? And so the fiend will have his will of the old miser at last. It’s a long time now that he’s been waiting for him! We’ll have a new landlord now, boys, and God send us a good one, for sure they’re not too plenty.’

‘They do say that he has left all his money to Master Charles,’ said the woman who had before spoken. ‘Biddy Moran will know all about it. Sure, she was at service in the big house when he came there first. I’m going to ask her about him now; and you had better come too, Tim Higgins, if you want to know.’

This speech caused a general movement in the direction of Biddy Moran’s. That lady rejoiced in the proud possession of a Government appointment, for she was postmistress of Ballinalack, and resided in the best house of the village. It had a slated roof, and was of much superior construction to its neighbours. Probably in the old days, when the Dublin and Sligo coach ran, it may have been an inn of some pretensions; but now it was divided into three tenements, and, by virtue of rotten woodwork, loose slates, and cracked windows stuffed with rags, was striving hard to assimilate itself with the recognised system of architecture of the cabins around it. It had not quite succeeded as yet, but no doubt would do so in time. In the centre one of the three tenements lived Biddy Moran; and a proud woman was she that day when her room was crowded with an attentive audience, and she was requested to relate all that she knew of Master Charles and his ways, and whether the rumour that he was to be their future landlord were likely to be a true one. In the pride of posses-

sion of information, she first of all exercised various petty acts of tyranny, made the men put their pipes out, and insisted upon the ejection of an old woman whom she regarded as a personal enemy, and who, having been compelled by the universal sentiment of the meeting, aided by a little use of physical force, to vacate the premises, seated herself on the doorstep outside and made the air vocal with complaints and threats. Being pacified by the ready obedience of her audience, Biddy at last condescended to take a chair, except of a half-noggin of whisky tendered her by an admirer, and begin her story, which she told readily enough, having the true Irish gift of fluency. Most of those present had heard it before, but never in such detail.

‘It will be ten years next Hallintide,’ she began, ‘since I first took service with old Dardas. I was only a slip of a girl then, and places were hard to get; and my father was behind with his rent and dreaded to be evicted by the old miser; so one day he went up to the big house to see if Dardas would give him time. The old man was as hard as nails, and must have his money down.

“Faix, then,” says my father, “you may evict me at once, for I haven’t got it to give you; and maybe you won’t get another tenant in a hurry to pay you ten pounds a year for a mud cabin that I propped up the wall of myself last summer with a stump of an ash-tree; and a couple of acres of marshy land that’s good for growing rushes and nothing else!”

‘Maybe the old fellow thought so too, for he considered in his mind a bit. “You’ve a daughter?” says he.

“I have so,” says my father.

“What age is she?” says he.

“Rising eighteen,” says my father.

“Well,” says old Dardas, “I’m in want of a servant just now; so, if you like to send her up here I’ll take her on trial and give her six pounds a year; and the first year’s wages can go to pay your arrears. After that I can deduct it from your rent.”

“Musha, then it’s yourself that’s the hard man,” says my father; “but make it ten pounds and it’s a bargain.”

“I said six,” says old Dardas, “and what I say I mean. Bring me your daughter or the money to-morrow, or you know what to expect!”

‘So the long and the short of it was that I had to go; and sure, anyhow, wasn’t it better than to have the old people (God rest their souls!) turned out on the road, with nothing to look for but the poorhouse?’

‘True for you, Biddy!’ said a sympathetic auditor, who had been through the same experience herself.

‘Murther! but that was the hard place I had of it!’ continued Biddy Moran, warmed, like a true orator, by the fellow-feeling of her audience. ‘Only that potatoes was cheap and plenty, I’d have been starved entirely; and as it was, I was famished with the cold; for the old man wouldn’t buy firing. He trusted to one tenant or another bringing him a load of turf when they wanted a favour of him; but sure there weren’t many were fools enough to do that, for mostly he kept the turf and sent them about their business. He was for ever prowling round to see I didn’t steal anything, though, dear knows, it’s little there was to

steal. When my father died and my mother went into the poorhouse, I made up my mind I'd go; but just then Master Charles came, and things got a little better.

'He was old Dardas' nephew; and I mind well the day he came, riding like a gentleman on a car from Multy Station. He had a face then that would do you good to look at; but it has altered since. He knocked at the door as if the place belonged to him, and when the old man came out, he shook hands with him as if he expected a hearty welcome. "Here I am, uncle!" says he. "You see I didn't delay long when I got your letter."

"So I perceive, sir!" says old Dardas, with a sneer on his face. "I did not expect you would!"

'And after that they went into the parlour, and left me and the car-driver to carry in the luggage. More by token the driver told me to ask the Master for a glass of whisky, and I had to tell him there was none in the house. "Faix, then," says he, as he gathered up his reins to drive off, "I wish the young gentleman joy of the place he is come to! I never yet knew good to come out of a house where they couldn't give a poor man a glass of whisky!"'

There were various murmurs of assent from the audience, who were evidently all of the car-driver's opinion. Biddy laughed, and continued her story.

'I was tidying up the kitchen that evening when Master Charles came in. He sat down in front of the fire and began to fill his pipe. "I am going to have a smoke down here, Mary," says he, "as the Master seems not to like the smell of tobacco up-stairs."

"Biddy, my name is, sir," says I, "begging your pardon for saying so."

"Of course—of course," says he, and I saw he blushed a little. "How stupid I am!" Then he got up and took a walk round the kitchen, looking at everything. "Why, Biddy," he says after a while, "you don't seem to have many cooking utensils. How do you get on at all?"

"Faix, there's plenty of them to cook all I ever have to put in them," says I. "If pots and pans were the only things wanting in this house, we'd be the better off!"

'Well, to that he said nothing, but just sat down again in his chair and smoked his pipe and looked into the fire, thinking, like. And when he had finished his tobacco, he only said "Good-night, Biddy!" and went off to his room. I thought, maybe he was offended at my free speaking; but I was determined to have my say, and not to let the old chap humbug him at the very beginning.

'Old Dardas seemed to take greatly to his nephew, and what's more, he let him have his own way in the house, and things soon began to mend. We had better food and more of it; and Master Charles glazed all the broken windows himself and mended the palings and gates; and by-and-by there came a load of furniture down, and the place began to look more home-like. I thought the old chap must be near death to be spending his money that way. But he was as hard as ever with his tenants; and except to Master Charles, I never heard him give a good word to any one.

'One morning I was bringing in the breakfast, and I thought I heard quarrelling in the parlour. They stopped when I came in; but old Dardas had a wicked look in his face that I knew well; and the young Master was reading a letter. So, when I went out, I just made a good noise going down-stairs, and then took off my brogues and stole up again in my stockinged feet to strive to hear what they were saying. It was the old man that was speaking when I got to the door.

"Now, sir," he was saying, "there's no two words about it. I'm not going to have a nephew of mine marrying a girl that hasn't enough money to buy her clothes, let alone to feed herself. If you want to have her, you'll leave this; and if you want to stay, you'll just sit down and write a letter giving her up; and what's more, you'll let me read it before it goes. You shan't have it to say that I didn't deal fairly with you. You are the only relation I have of the name; and if you obey me, I mean to leave you my money when I die. Ten thousand pounds it is, and all in good Midland Railway shares; and the farm to the back of it. If that's not worth more than any girl that ever was born, be she whom she may, just say so and be off with you, for you shall be no heir of mine."

"But, uncle," says Master Charles; and then, as ill-luck would have it, a troublesome cough that I have at times began with me, and I had to hurry down-stairs again for fear I'd be caught; so I heard no more of it. But after that day I noticed a change in Master Charles. He had a kind word for me still; but his face was turned hard like, and he didn't whistle about the house the way he used to do. The old man treated him well enough, and bought him a thoroughbred to ride to the hounds, and he had the best of clothes; but sure what's them things to a man when his heart is sore?

'True for you, Biddy!' from the audience.

'Now,' continued Miss Moran impressively, 'mind, I'll not have a word said agen him! He has a kind heart of his own, or at least he had when I knew him; and when the old miser turned me out of his house for giving a haporth of meal to a beggar that came to the back door, it was Master Charles that saved me from the workhouse, and got me put into the Post-office. He's not been to see me since, and I've heard that he's turned hard on the people, like his uncle; but mark my words—he'll make you a better landlord than ever old Dardas did.'

'Sure, he couldn't make us a worse, so that's but poor comfort, Biddy,' said a man.

'Good or bad, he'll be good enough for you, Pat,' said Miss Moran scornfully. 'The best man that ever you were, an ass and a cart could draw you!' Under cover of which brilliant piece of repartee the lady withdrew into the privacy of her shop, and her audience slowly dispersed to talk over their future prospects.

Meanwhile, the hero of so many thoughts had reached the Glebe House, and sent in his name to the clergyman, who at once admitted him to his study. It was a warm, well-furnished room, and formed a strong contrast to the outward appearance of the Rectory, which was an ugly square building, standing on low-lying land not far from the Inny, a veritable 'House on the Marsh,' always surrounded with mist and fog

during the winter months, and sometimes the whole year round when the summer was a wet one. A terrible place for children with their delicate lungs and throats, as more than one poor clergyman had learned to his cost. But its present occupant was unmarried and had a constitution of iron, and so was able to make a jest of his unenviable residence.

He came forward to meet his visitor—a fine tall man with iron-gray hair, and massive forehead and chin—not the ordinary type of a clergyman by any means, unfortunately!

Charles Dardas briefly explained his errand—his uncle was dying, and had expressed a wish to see the clergyman. There was no time to be lost; and if the Rector could conveniently drive back with him on his car, he would esteem it a great favour.

The Rector stepped forward to the hearth and put one or two sods of turf on the fire; then stood up and looked the young man in the face very gravely. 'Certainly I will go with you, Mr Dardas,' he said. 'I wish I could say "go gladly," but that would scarcely be true. I am weary of people sending for me on their deathbeds, that by some magical process I may make their peace with the Almighty, whom they have never thought of in their lives. Am I not right in supposing that your uncle never attended church—or you either, indeed, sir, since you came amongst us?'

'My uncle has never attended church since I knew him,' answered the young man coolly, and with a shade of surprise at the question in his manner. 'As for me, sir, I cannot recognise that you have any right to inquire as to my private affairs—you must forgive me for saying so.'

'I fear you are ignorant of the duties and responsibilities of a clergyman,' said the Rector quietly as he put on his overcoat. 'However, the most urgent duty at present appears to be to see your uncle; so, with your permission, we will start at once. It will be dark before we get there.'

'I have lamps on the car,' said the young man as he followed him.

Twenty minutes later they had reached the gate which closed the short, straight avenue leading up to the house of Mr Dardas. It was now quite dark; but rain had ceased, and the car lamps gave light enough to enable them to see their way, though the path was neglected, and had not, clearly, been gravelled for years. At the door of the house they were met by the successor of Biddy Moran, an unkempt Irish lass, with tangled hair and short petticoats, who was weeping profusely, as all her nation can on very slight provocation.

'Oh Master Charles,' she cried, as she saw the pair approach, 'why were you so long coming? Sure the Master is dead this ten minutes!'

The young man started slightly, but gave no other sign of emotion. Then he turned to the clergyman. 'Would you mind coming up to see him, sir?' he said, 'or would you prefer not to do so?'

'I will go!' said the Rector, and was about to mount the stairs, when he saw the servant clutch her young master by the coat and whisper something to him eagerly.

The young man laughed. 'She says, sir, that

she has laid the body out with candles; but if it displeases you, she will run on in front and put them out.'

'Leave them burning, by all means,' said the Rector. 'They cannot harm the dead, and it was a kindly thought on her part.'

Then they mounted the stairs, and Charles Dardas opened the door of his uncle's room. It was an ill-furnished ugly apartment, with no pictures or ornaments; nothing but the practically useful, and barely enough of that. At present it was, however, a blaze of light, owing to the tapers which the Irishwoman had lit at the head and foot of the bed. There was no one in the room, for the doctor had left an hour before, not expecting so speedy an end to his patient. The two men approached the bed and looked down on the face of its occupant. It had been an unlovely face always, and the hard, cruel, expression seemed to have been only intensified by death. The chin and upper lip were covered with a stubby growth of gray hair—the result of a fortnight's want of shaving, and the open eyes glared upwards in a ghastly and intolerable manner. As they watched him, it seemed to them as though there were still some remnant of life dormant in those glassy orbs. The young man bent over and took the wrist of the limp arm in his hand, with a view to feeling if any pulse were there. The touch, light though it was, seemed to act like the shock of a galvanic battery. The apparent corpse rose in the bed and sat upright. With a wild shriek, the servant fled from the room, down-stairs, and out of the house. But the men had firmer nerves, and though greatly startled, stood where they were, and interrogated one another with their eyes.

THE UTILITY OF SMALL CURRENCY.

THE gradual cheapening of different articles has led of late years to a greater demand for the class of small bronze coins which have superseded copper money since 1860. Not much use is at present indeed made of the farthing, but the half-penny and penny coins are more in request than formerly for newspapers and stamps. The itinerant street-vendors, the shoeblacks, the automatic fixed distributing machines, the flower-girls, the penny omnibuses, and a hundred other similar demands, call upon us continually for coppers; and the public were lately glad to add to their supplies by French pennies, until these were called in and cancelled. Whether there is enough of bronze money in circulation at present is somewhat doubtful; and if it can be substituted for a coin of any better metal is a question for future consideration. The Belgian and American ten and five cent bits are certainly more cleanly and convenient than our ordinary copper coins.

In the eleven years ending with 1889, the bronze money coined at Birmingham (for the London Mint only coins silver and gold) has amounted to £513,423, or, on an average, about £46,000 in value yearly. This would give us about eleven million pennies per annum; but of course a portion of

this consists of halfpennies, and much of those in circulation are lost. In 1888 four million bronze cents were coined for Canada; 100,000 for Honduras; 500,000 for Mauritius; and 50,000 for Newfoundland; and 192,000 nickel farthings for Jamaica. Small coins are a greater necessity even in other countries than with us, and many substitutes have been, and are still, adopted in localities where the price of commodities is infinitesimally small.

The mite—a very small coin, the half of a farthing, known as 'beggars' money'—is still used as alms in Asia Minor, but is not current in the markets, being scarcely of estimable value.

Tokens, certain tradesmen's coins, were current a few centuries ago, but are now prohibited. A token was also a coin ordinarily of less value than its current price, or not of public Mint coinage. These were all called in on the revision of the coinage many years ago. The old Roman *quadrans* or farthing was the fourth part of an *as*, a coin gradually reduced in weight to half an ounce, and worth about $\frac{1}{4}$ d. or 1d.

In India they have very minute circulating mediums; thus, there is the 'pice,' a small copper coin, the fourth part of an 'anna,' the anna being nominally worth $1\frac{1}{4}$ d.

Passing farther east, we find a small metal currency is in great demand in China. The 'cash' is the common coin of the Chinese, eighty being only worth about 2d. They are made of a very base alloy of copper, are round, about the size of an English farthing, and have a square hole in the middle, by which a hundred or more are usually strung together. On one side are Chinese characters denoting the reign under which they were cast; and on the other side are either Chinese or Manchu characters designating the place of coinage.

In France and Germany, minute coins, centimes and pfennigs, ten to a penny, still circulate. The Americans have their cents.

Shell-money, in use in various parts of the world, is a curious medium of currency deserving special notice. One entire small shell, the money cowry ('*Cyprea moneta*'), is very popular, and largely employed. In Africa, the 'simbe' or cowry is the minor currency of the country. It is brought from the eastern coast by caravans. From five hundred to a thousand cowries will buy a cow in some parts. The 'tookow,' five strings, or two hundred, are worth about 8d. The 'ackee' or 'aki,' consisting of sixteen hundred cowry shells, is the monetary standard of the Gold Coast. The imports of cowries into Lagos have sometimes reached seventy to ninety thousand hundredweight, but have been declining of late years, having lost their value. In the Eastern Archipelago, about twelve hundred cowries are worth a dollar. A church in the East Indies, which cost four thousand pounds in the erection, was paid for wholly in these small shells, and it must have taken about thirty million to pay the workmen.

The ordinary gradation of value on the west coast of Africa is—forty cowries equal one string; two and a half strings, or one hundred cowries, are worth one penny; fifty strings, or two thousand, equal one head; ten heads, a bag; three heads, or six thousand, are worth about a dollar. In other places they are valued at about one and

threepence the thousand. Sometimes sixty thousand or a hundred thousand (or from three pounds fifteen shillings to seven pounds ten shillings) would be given for a young wife; whilst a more common or ordinary wife may be had for twenty thousand cowries, or twenty-five shillings.

In Soudan, much as the people trade, they have no other currency than the cowry, of which two thousand, weighing from five to seven pounds, are worth only a dollar. One of the tribes of the Khasia Hills, India, has a simple and cheap mode of divorce—the husband merely gives the woman five cowries, and she throws the shells away. They are then free to be married again.

Cowries have served the purpose of a petty currency for many centuries, and are still used for local dealings in India, the Eastern Archipelago, and parts of Africa. In the Eastern bazaars they are made use of for fractional payments, and their value rises and falls according to the demand and the quantities in the market, six to seven thousand being worth two shillings. The Hindu currency in them is about as follows: four cowries equal one ganda; twenty gandas equal one pan; sixteen pans equal one kahan. The present rate is twenty-four gandas, or ninety-six cowries, to a pice. Four pice make one anna, and sixteen annas go to the rupee; and hence $96 \times 64 = 6144$ cowries to the rupee, or two shillings.

The extension of the foreign trade has, however, caused cowries to be greatly superseded by a more portable metallic currency. Cowries are largely imported into Bombay, chiefly from the Laccadive and Maldive Islands, and Zanzibar. The imports to India average from nineteen to fifty thousand hundredweight annually. Good bright white cowries will fetch about seven pounds per hundredweight; dead shells and 'blue-backs,' as they are termed, are not worth half this price. These shells are found in myriads at the Maldive Islands, situated about four hundred miles from Ceylon. Twice a month, at neap-tides, men and women wade into the sea and gather them up from under the rocks to which they attach themselves, one person sometimes gathering as many as twelve thousand in a day. They are then buried until all signs of putrefaction have disappeared, when they are generally packed for market in triangular coconut-leaf bags, called 'pottas,' which weigh about twenty-five pounds each.

Unlike most of the mollusca, which enlarge their shells or dwellings as they grow larger, the animals of the cowry family at certain seasons cast their shells and obtain new ones; hence a number of what are termed dead cowry shells are obtained, which have a dull aspect, quite dissimilar to the bright enamelled shell which is tenanted by the living animal.

The value of cowries there has fluctuated very considerably of late years, and ranged from four hundred thousand to twelve hundred thousand to a 'dinar' of gold, or nine shillings. One hundred of these shells is called 'syah'; seven hundred, 'fal'; twelve thousand, 'cotta'; one hundred thousand, 'boston.'

Under the name of 'wampum,' certain white and black shells, strung on a ball, were used as money by some of the North American Indians. The shells used were a periwinkle, and the

round or hard clam ('*Venus mercenaria*'), a bivalve. The blue or violet portion of the latter shell furnished the material for the dark wampum, which was held in much higher estimation than that made of the white part of the shell, or of the spires of certain univalves. These formed the specie currency of the natives: six of the blue and three of the white were equivalent to an English penny.

Another shell passing as money was the tooth or tusk shell ('*Dentalium pretiosum*'), which occurs all along the northern Pacific coast of America. It is a long milk-white tubular shell, of extreme hardness, resembling in miniature the shank of a common clay pipe. It varies in length from one to four inches, and is about half an inch broad and hollow, slightly curved, and tapering a little towards the ends. From Northern California all the way to the Arctic regions, the coast tribes collected this shell, polished it, and arranged it on strings as money—a circulating medium of trade—similar to the 'wampum' of the eastern coast. There were certain rules as to fineness, arrangement, size, and measurement, which decided the value of the shells before and after stringing. The Hudson Bay Company and other traders adopted it as their current coin in buying and selling provisions and peltries. Their currency value in the fur regions was: forty shells, extending one fathom, one beaver skin; thirty-nine shells, one fathom, two beaver skins; thirty-eight shells, one fathom, three beaver skins.

Another form of aboriginal American money was made from the valves of the ponderous clam of Southern California. This money was called 'lawok,' and took the shape of perforated discs, which could be strung as beads.

BUNCOED.

It is the opera in New York. The ballet is in full swing. In one of the stage boxes are Mr Brandon, a well-to-do Yorkshire Squire; his only daughter, Constance; and Mr Morton, a local financier. 'Things of beauty,' in clouds of gauze, float silently hither and thither in a blaze of light across the stage. The local 'dude' in the stalls, as he listens to the lively strains of the viol and the flute, and levels his glasses on the lovely forms of the *première* and the *super*, feels that nothing more is wanted to produce in him a state of perfect sensuous bliss. Yet the Squire sleeps soundly all the while; Miss Constance is decidedly drowsy and a little bored; the financier alone is wide awake, though his eyes are not on the stage. Presently, the first act closes. Mr Brandon still sleeps on; Mr Morton disappears. Miss Brandon thereupon heaves a gentle sigh of relief. Suddenly, she starts, leans forward, and fixes her glasses upon a man who for some time past has been steadfastly regarding the box. When she removes them, her eyes sparkle and her face glows. She is not bored nor drowsy now. Finally, the curtain falls. Mr Morton goes for the carriage. Mr Brandon wakes up, and leaves also, followed by Miss Constance. At the door, she suddenly halts, quickly turns, advances to the front of the box, takes a bunch of carnations from her breast, throws it far into the

middle of the orchestra, and then rejoins her father—all in a moment. It falls at the feet of the first fiddle, who bows low, and instantly picks it up.

Put back, now, the dial on the clock two years; change the scene from New York to Yorkshire; look out from the study window of Staunton Castle over a fair demesne, glowing in the glory of an August sun. Turn again, then, and give ear to the last words of Sir Clement Staunton and his only nephew, Captain Clement Staunton of the —th Lancers. Yet first take stock of the two men. The elder, his once powerful limbs enveloped in a long robe, is lying back in a deep chair, idly quiescent. Beneath a black skullcap gleam deep-set gray eyes, restless and suspicious, telling of the existence of a volcano behind them still far from extinct. The other, standing in riding costume, with a hunting-crop in his hand, is a fair replica of the old man as to physique, a certain bold, defiant look being also common to both. But the suggestion of an evil heart, impressed on the countenance of the Baronet, is not to be seen on the bright sunny face of the debonair Captain.

Sir Clement. I hear, Clement, that you are again deeply in debt. Is that true?

Captain Staunton. Quite true, sir. I do owe a few hundreds.

Sir C. And pray, Captain Staunton, how do you propose to liquidate these debts, and when?

Captain S. With your kind assistance, sir, at your earliest convenience.

Sir C. This is the third time within three years that you have become involved. Your extravagance is shameful.

Captain S. On the contrary, I consider myself deserving of great credit for the moderation of my expenditure.

Sir C. Are you aware, sir, that you are a black-guard for incurring debts you cannot yourself discharge?

Captain S. Before I reply to such an impudent question, favour me, sir, if you please, with your attention for a few moments. At my father's death I became, as you know, heir-presumptive to the Baronetcy, though not to the estates. I was then eleven. You were my guardian. Two courses were open to you. You might have given me a middle-class education in a commercial atmosphere, where there would have been perhaps opportunities afforded me of making money; in which case I should not, of course, have regarded myself as heir to your estates. Or you might, on the other hand, have brought me up at a fashionable school along with those born with silver spoons in their mouths, under which conditions I should have been justified in considering myself your heir. You were pleased to choose the latter course; and accordingly I did consider myself as heir-presumptive to the family estates, which are said, by the way, to be worth some fifteen thousand a year. Now comes the point. Did you, sir, under these circumstances allow me a sufficient income to keep up the credit of the family? I say emphatically that you did not—that, on the contrary, you gave me—the prospective representative of the family, chosen as such by you—the wages, in the shape of an allowance, of your butler; and when I failed, as of course I did, to sustain

creditably my status in society on that dole, you now ask me if I am aware that I am a black-guard. In return for one question, let me put to you another. What shall I say of a man who deliberately and of set purpose places his chosen heir in such a position that he cannot avoid coming to grief, and then, when he does so, instead of throwing him a life-buoy, applies to him opprobrious epithets?

Sir C. I shall not condescend to reply to your insolence further than to recommend you to consider at your leisure this, my ultimatum. If you think proper to throw up your commission and leave the country, your debts will be paid once more, and an allowance of fifty pounds per annum made you. Should you determine otherwise, you will receive no further assistance from me, now or ever.—Good-morning.

Back again to New York.

'Well, my dear,' said the Squire to his daughter the day after the opera, 'you know Mr Morton is expecting his answer to-day; what am I to say to him?'

'Father, dear, you must tell him No—that it cannot be.'

'But are you wise? He is a good fellow.'

'Yes, I know, father. But I prefer to remain Constance Brandon than to be the wife of Mr Morton. Don't be angry with me. Read this letter, and you will understand why it is now impossible.'

The Squire took the letter. Thus it ran:

DEAR CONSTANCE—I noticed your name this morning in some paper among the lists of those staying at the *Clarendon*, and was therefore not very much surprised to see you last night. When we parted two years ago, I expected never to have seen your dear face again. Perhaps it would be wiser, under the circumstances, still to keep away from you. If you think so, you will not be at home to me at two o'clock to-morrow, when I shall call at the *Clarendon*. Yours ever—JOHN CLEMENTS, First Fiddle, *alias* CLEMENT STAUNTON.

'Well, and what do you propose to do, my dear?' said the Squire.—'Clement Staunton a first fiddle! Dear me.'

'Do, father? How can you ask?—Dear Clement!'

At two o'clock on the following day Miss Constance sat in the salon of the *Clarendon*, waiting confidently the arrival of the Captain. At three o'clock she still waited hopefully—at four o'clock anxiously; and at six o'clock she gave him up for the day. 'Of course he will write or come to-morrow,' she said to herself encouragingly. But he came not the next day, or the next to that. Nor did any letter of explanation arrive. By the end of the third day the patience of the lady became exhausted, and the Squire was ordered at once to make inquiries at the opera. He did so; but received only the unsatisfactory intelligence that the first fiddle had been absent from the orchestra for two days, and, moreover, that he had not been at his home during that period. It was the opinion of the authorities that he had been kidnapped, or otherwise made away with. The proper course for him now was to proceed to

the police, report the disappearance, and ask for advice and assistance.

On announcing his business to the inspector, that functionary quietly observed: 'I guess your friend has got among the Buncoes.'

'Excuse me, sir. Got among the Buncoes? Pray, what are the Buncoes?'

'As a Britisher,' he replied, 'you may well be ignorant of the name given here to a number of scoundrels who infest this city—a gang whose business it is to entrap or decoy into their toils those whom they consider worth being robbed or held to ransom; their prey usually being foreigners.—Yes, sir,' he continued, 'we call them Buncoes here, though they are classified in Sicily and Asia Minor as brigands.'

'Do I understand you to mean,' said the Squire, 'that people actually disappear altogether in New York?'

'When they fall into the hands of the Buncoes, they sometimes do; at others, they are merely robbed or held to ransom for a time and then released again. There are cases when, through fear of the police, they are at once set free.'

'This is indeed serious,' said the Squire.—'But what is to be done? This gentleman is a relation of my family. It will be terrible if your suspicions are correct, and he is in the hands of these miscreants.'

'There is nothing to be done, sir, but to leave the case in our hands. It will be necessary in the first instance to offer a handsome reward. Should Mr Clements have got—as is most likely the case—among these rascals, they will soon find means of letting us know the fact and their terms. Favour me now, sir, if you please, with your address. Should any news come to us, you will be duly advised. Good-morning.'

'Constance, my dear, I am the bearer of bad news. Clement Staunton has mysteriously disappeared. They know nothing of his whereabouts either at the opera or his home. On the way home I saw the inspector of police, told him all the particulars of the case, and asked his advice. He recommended me to offer a reward, and leave the case in his hands. I have done so.'

Constance Brandon and Clement Staunton were very old friends. As children they had been neighbours. Later on, they came to be something more. Then came the day of wrath, when, in an evil hour, his prospects were blighted; and he went to join the grand army of those who, through crime, misfortune, or folly, have gone under. In writing to bid her farewell, he told her the story of his folly, and that he was on his way to America with a changed name. So was she left lamenting, but free.

'Father,' said Miss Brandon as soon as she had grasped the situation, 'we can do nothing, as the inspector says, but wait for the result of the offered reward. The suspense, though, will be terrible.'

And they did wait, hour after hour, and day after day, for more than a fortnight. But no tidings came of the lost one. Nevertheless, the police had not been idle. They felt satisfied that Clements had got among the Buncoes, but could hear nothing whatever of him. Though, however, their investigations failed to obtain any intelligence of the particular man they wanted, yet, strange to say, they led to the discovery of

the captivity among them of another Englishman whom their spies reported to be a nobleman of large possessions. The inspector, in reporting to the Squire his ill success with regard to Clements, incidentally mentioned in his letter this curious discovery. Perhaps, he added, the Squire might know something of this individual. Would he oblige by calling at the station?

'I'll look round to-morrow,' said the Squire. 'The man may have no friends here, and we may be able to assist him.'

'Yes, do, father. It is even possible we may know him. Poor fellow!'

The next day at breakfast the Squire, who was reading a paper, suddenly exclaimed: 'Listen, Constance. "At Staunton Castle, on the 30th ult., aged eighty, Sir Clement Staunton, Bart."—This is news indeed; and observe, it is dated more than a fortnight ago. I suppose the lawyers have continued advertising the death after the usual time, in order to apprise Clement, of whose whereabouts they are probably ignorant, of his succession.'

'Go down at once, dear, and see the inspector,' broke in Miss Constance. 'He must be found. Double the reward, if necessary—treble it!'

'We have still no news of the missing man,' said the inspector, when the Squire appeared—'none whatever. But perhaps you can tell me about another of your countrymen, whom we believe they've got hidden away somewhere—a Baronet, Sir Clement Staunton.'

'Of course I can. Why, he is this same man. Less than three weeks ago he succeeded to the Baronetcy of his uncle. He was then living here under the assumed name of John Clements. But how did they know that he was now Sir Clement Staunton? That beats me. Does it not surprise you?'

'I do not wonder, sir, at your being surprised,' replied the inspector; 'but I am not, for I happen to have made a special study of these Buncoes, and can tell you all about their ways and means. In the first place, they make it their chief business to find out, through servants and others, who strangers from abroad living at hotels and elsewhere really are. In the second place, should their investigations result in the creation of a suspicion that a certain person might be worth running-in, he is persistently "shadowed." In the third place—— But what you want to know is how it came about that they identified this John Clements with Sir Clement Staunton. I guess, sir, they arrived at that conclusion pretty much in this way. I take it for granted that John Clements has all the ways and manners of an Englishman of good position. At the same time, I understand he is employed at the opera as first fiddle. Now, it is not usual for Englishmen of his class to gain their living as musicians in a New York orchestra. Therefore, those about him place him as a man who has seen better days in England—a refugee, social or otherwise, who, under a false name, is lying low for a time out of the way. Again, it is nearly certain that by some accident or other it was ascertained by those whose minds were exercised about him that your missing friend was not only not John Clements, but that he was Clement Staunton, late —th Lancers. You will naturally ask of what value to them

would be, if entrapped, the body of a broken-down British Captain? I reply, none whatever, so long as the Captain was only Clement Staunton; but when he suddenly becomes, as they suspect, Sir Clement Staunton of Staunton Castle, Baronet, his value in their market shoots upward like a sky-rocket. You tell me that it was only yesterday you knew of the death of Sir Clement, though it happened more than a fortnight ago. But what was there to prevent the Buncoes learning the fact as soon as it was announced? Now, knowing them as I do, there seems to me to be no doubt that they had had their eye on John Clements as a possible victim from the very first; and that, when they discovered him to be Captain Staunton, they forthwith shadowed him: that they then noticed the death of Sir Clement when first announced, and immediately perceived, on the strength of the identity of names, the extreme probability of the Captain being the relation—perhaps the heir, or one of the heirs, of the deceased Baronet. If they did not run him in on this chance, they would not be the Buncoes I know. No, sir, you bet!'

'Very well, then,' said the Squire. 'The only question now remaining is the amount of the ransom. The present reward does not seem to be sufficient; it must therefore be doubled, or trebled.'

'I will see to that at once,' said the inspector.

The offer of an increased reward had happily the desired effect. At two o'clock on the afternoon of the third day, Clement, to the great delight of the Squire and his daughter, appeared at the *Clarendon*. After endless congratulations and requests to relate his experiences, he thus began:

On my way here one day, just as I entered Broadway, a man sidled up to me and attempted to draw me into conversation. He was not a bad-looking fellow; but as he was an utter stranger, I cold-shouldered him. Nevertheless, he continued talking; and at last, as I did not reply, said: 'I see you're offended, sir, at my presumption in addressing you.'

'Not at all,' I replied.

'Well, to prove that's so,' he went on, 'come round to my place and have a cocktail. If you're fond of books, I can show you some curious ones. I have a lovely illustrated edition of Longfellow, our national poet, you know. Perhaps you would do me the honour of accepting it?'

Not being at the moment in want of either a cocktail or a book, I declined his offers, and he presently departed. Continuing my stroll, I was soon again accosted by another man. 'Ah, Captain,' he said, 'how are you? You don't remember me?'

'Indeed, I do not,' I replied.

'Surely you haven't forgotten that day at Sandown when I laid you six to four in fivers on the field, and lost it? I was a bookey then.'

Now, I happened to be myself betting a good deal at one time there; it was therefore possible I might have had some dealing of the sort with this man. Still, I did not recollect him at all, and said so. Nevertheless, to be civil, I inquired what he was about.

'I am in the *curio* line now over here,' he

answered, 'got a ripping store down town full of pretty things. Will you come and see them, sir?'

'Not now,' I answered.

'Come, then, to my house and see some lovely bits which I haven't the heart to part with. There is a Stradivarius worth ten times its weight in gold. I won't keep you five minutes.'

I don't think any other fly in the world but a Stradivarius would have risen me, but I did rise to this one. A quarter of an hour later, we were standing opposite a door in a quiet street. He opened the door with a latchkey; we passed in, and mounted to the first floor. Opposite the staircase was the opening to a large room.

'In here, sir,' said my friend as he passed the threshold. I followed unsuspectingly. A man was standing looking out of the window. As I reached the centre of the room, he turned. In him I recognised at once the fellow who had offered me the cocktail. I turned round quickly. My guide was standing quietly with his back to the door, the key thereof in one hand, a revolver in the other.

'What is the meaning of this?' I asked him angrily.

'It means, Sir Clement, that you are Buncoed. You were hard to get, though.—Wasn't he, Charlie?' turning to the other blackguard; 'but Buncoed you are and no mistake.'

'Buncoed! What's that?'

'That means that you are the guest of the Buncoes for the present.'

'Who are the Buncoes?'

'Never you mind now who they are. But you need not be alarmed: so long as you're quiet, you will be well treated, only no bounce. Let me now offer you some refreshment?—No. Well, perhaps you may fancy something later.'

Furious, but powerless, I exclaimed: 'You called me just now Sir Clement. That is not my name. It is John Clements.'

'It is quite true,' he replied, 'that your name the other day was John Clements—to be accurate—your assumed name; but it is now Sir Clement Staunton, Baronet. If you doubt me, look at the deaths in the *Times* there.'

I took up the paper; and, sure enough, there appeared the announcement of my uncle's death.

'Now, look at the top of the second column, and I think you will find an advertisement there to this effect: "It is requested that the nephew and heir of Sir Clement Staunton, of Staunton Castle, Yorkshire, who is believed to be living in New York under an assumed name, will communicate at once with Messrs Jones & Co. of London."—Probably you did not see either the announcement or the advertisement' (which was there, as he said); 'but we noticed both; and putting them together, could come to no other conclusion than that John Clements, *alias* Clement Staunton, is identical with Sir Clement Staunton.—Come, Sir Clement; there is no use whatever your denying this. The easiest way for you to get out of your difficulties is to accept the situation and play fair with us, cards on the table. Remember that you are a rich man now, and that we run tremendous risks. What, then, will you give to be free? How much will you plank down? Shall we say five thousand?—pounds, not dollars.'

I laughed aloud at the absurd idea of my finding such an amount. 'I am quite willing to admit,' I answered, 'that I have succeeded to my uncle's title, but have every reason to believe that I shall not benefit by his will; for, although I am his next of kin, I am certainly, as you will find, disinherited.'

'Well, sir, the truth of the matter on that point can easily be ascertained by reference to our friends in England. Meanwhile, we shall have to detain you till we receive their answers to our inquiries. You will find here everything necessary, as far as is possible under the circumstances, to your comfort. But, remember, the key of the door is always in one of my hands, and this article here'—he lifted the revolver—'in the other.'

At the same time a door opened, and another fellow appeared. With a polite bow, he said: 'Would you like to see your bedroom, sir?'

I will spare you any description of the weary days of my imprisonment, and only tell of what passed this morning. It would seem, then, from the conversation of my jailer, that soon after I was missed, some good Samaritan offered a reward for me; but that they had determined to await the report of their correspondents in England on the will before considering the question of its acceptance. This report came yesterday, and was to the effect that I was actually disinherited in favour of some distant relative. There being now no doubt of the fact, and considering the amount of the reward, which appears to have been doubled within the last three days, they determined last night to release me as soon as the money was secured. It came to hand this morning, and here I am. Voilà tout!

Let six months now pass away; change the scene once more from New York to Yorkshire. Look out again from the study window of Staunton Castle and watch the wandering sunshine stealing silently from the stream to the hill, from the forest to the flowers on the lawn. Turn again, and note the occupants of the room. You have seen them both before—one as Constance Brandon, boldly casting a bunch of carnations far into an orchestra, the other as John Clements, fiddling to a ballet; or, as Clements Staunton, uttering words of high disdain to a venerable relative. But how came they there? you naturally ask; for, in fact, the disinherited looks as if the place belonged to him, and Constance seems equally at home. 'Yes; how came they there? That is what I want to know, too,' repeats a hollow sepulchral voice. In an instant I recognise the imperious tones of the late Baronet, and perceive the dim outline of his imposing figure. 'Look at that blackguard!' it began, as with uplifted finger he pointed to the living Baronet. 'I cast him out, it was but yesterday, for ever from Staunton Castle; and lo, here he is back again, seated in my own chair!—What, sir,' he asked, 'is the meaning of his presence here?'

I expected Sir Clement to have risen at the question, delivered as it was in a loud imperious tone. But he never moved. Probably, he failed to catch the sound of the voice. It is not perhaps given to every one to hear the words of the spirits of the departed.

'His presence here, sir,' I reply, 'would seem to be accounted for by the fact that he owns the castle—or, to be accurate, the lady over there with the pug in her lap, Constance Staunton, *née* Constance Brandon, inherited it from you, and he owns her.'

The Ghost—'And that is Constance Brandon, my next of kin after that scoundrel there—my heiress, sole possessor of all my wealth! It is well for her I suspected not that it would have come to this.—Confound her!—But tell me, sir, how it came to pass that in marrying this man she made the only marriage that could have defeated my plans?'

'It happened,' I reply, 'in this wise. Miss Brandon and her father were travelling in the States. In New York she met a certain prominent citizen, Mr Morton, who loved her; and she might have been "the happiest in the land;" but it appears that "she fancied a cove who played the fiddle in the midst of a German"'

Here I suddenly stop, for the ghost, who had been listening attentively with his hand to his ear, suddenly vanished—and I rubbed my eyes.

Had I been dreaming? Perhaps. And yet this story is not altogether a romance.

THE CANADIAN CENSUS.

THE Canadian Census has just been completed, and the returns sent in are proving a source of keen disappointment all over the Dominion. The population of the various provinces, as compared with that of a decade ago, is as follows: Nova Scotia has a population of 450,523, as against 440,572 in 1881. New Brunswick, 321,294, as against 321,233. Prince Edward Island, 109,088, as against 108,891. Quebec, 1,488,586, as against 1,359,027. Ontario, 2,112,989, as against 1,923,228. Manitoba, 154,442, as against 65,954. British Columbia, 92,767, as against 49,559. North-west Provinces Unorganised Territory, 61,487, as against 56,446. Allowing, therefore, for natural growth and the vast tide of emigration which has flown into the Dominion for some years past, the increase in population does not exceed 500,000. In the Maritime Provinces the gain is slightly more than one per cent.; in Quebec it is 9·53 per cent.; in Ontario, 9·63; in Manitoba, 148; in the North-west, 141; in British Columbia, 87·50; and in Unorganised Territory, four per cent.

The growth of population appears to be least in the provinces of Nova Scotia, New Brunswick, and Prince Edward Island. The cause is not remote. These provinces are almost wholly agricultural, Prince Edward Island entirely so; but there are no large holdings. Hence, when the farmers' sons and daughters grow up, and have received a fair education, they flock to the United States of America, where they all receive immediate and remunerative employment, the females as domestic servants, dressmakers, factory hands, and store-waiters; the males as labourers, mechanics, and clerks. It is commonly reputed that the city of Boston alone includes in her vast population at least 40,000 Canadians and their children. This leakage is serious, but at present constant.

In the great provinces of Quebec and Ontario,

the increase, though pretty considerable, is at least 25 per cent. less than it should be, since in Quebec at least 80 per cent. of the population are French Canadians, the most prolific race in the world; and Ontario is in many respects the most attractive of all the Canadian provinces.

But in Central as in Eastern Canada the increase of population is checked by the same cause, nor is it likely to cease for a long time to come. When these portions of the Dominion shall have developed the numerous important industries which Nature has designed for the support of their peoples, young Canadians will have no object in seeking employment in the Republic across the line, but will remain within their own borders, where now they may earn an honourable and sufficient living.

It was to be expected that the returns would show a large increase to have taken place in the North-west Provinces, since thitherward the tide of emigration from Great Britain and, latterly, Iceland, has always set since the Canadian emigration scheme was first promoted; but here also the gain has been much less than was expected. For years past the statement that Canada contained 5,000,000 people has gone uncontradicted; we now find her population to be many thousands less, or about the same as that of London.

ROMANCE.

WHERE brooding rain-clouds, grim and hoar,
Drag and drip for evermore
On a sailless sea, and a sullen shore;

On the nether rim of a northern clime,
Where year to year it is winter-time,
And all things taste of the salt sea-rime;

In a brine-bleached tower, with beetling walls,
Where the raven breeds, and the seamew calls,
But never a shaft of sunshine falls,

There lived a maid, from her natal hour,
To whom the wilful Fates for dower
Had given a heart like a cactus-flower—

Warm, and vivid, and flame-like keen.
Such was her soul; but her face, I ween,
Was the ice-cold face of a polar queen.

And I—I came from a land of fire,
Where the pitiless sun-rays parch and tire,
And the shower and the shade are a man's desire.

I had drifted far on the sailless sea,
I had come long leagues. For it was to be,
And her woman's love leapt out to me.

Time and distance, longing and hate,
Wooing and winning, and all things, wait
For the rounded sweep of the scythe of Fate.

And the bars, and the bonds, of sea or land,
That the stride of a destined step withstand,
Are as bars of pith, and as ropes of sand.

ENTERTAINMENT-GIVING.

THAT men and women have strong social instincts is so self-evident a fact as scarcely to call for mention. We seek to replenish the fires of our own life at the vital stores of others. In the beginning, it is as intensely selfish a desire as an infant's craving for nourishment; but ultimately the selfishness of it may be transmuted into the most loving service, for, as we ourselves grow more conscious of our own needs, we seek to supply the needs of others.

Women are natural entertainers; and it will be readily granted that in pleasing others they find much of the pleasantness of life. That many signally fail in this must be due to the fact that they have never thoughtfully and earnestly endeavoured to cultivate the gift. It has often truly been said that a sermon, or a reading, or indeed any bit of work, must have a person behind it; then, and then only, will it tingle with that life which will be felt by the hearer or onlooker. So it must be in entertaining. There must be a woman behind it, charged with the electricity of sympathy and kindliness. She must be endowed with that capacity for total self-forgetfulness and that power of entering into the thoughts and interests of her guests which impart a rare charm to a hostess. Dora Greenwell's invalid sofa was a source of light and inspiration to many just through this divine faculty of bringing forth all that was best in the people who visited her. And it was this same quality that made George Eliot a most delightful person to meet.

Given a hostess with quick bright sympathies, many evils which make our social circles a reproach are done away with. She who has a true ideal of entertainment will not stoop to play at precedence with her neighbour entertainer, and will be content, if she has made the world a little happier, even if her table appointments and the brilliance of her gathering are not quite equal to those of her friends. Some may hold that entertainments should be purely recreative, and that the tension should be relaxed where only a

pleasant evening is aimed at. But we find that what elevates also truly recreates; and the two can exist perfectly together—nay, never exist well apart.

Nowhere does the capacity of a hostess better appear than in the choice of her guests. It involves nice judgment of the characters, pursuits, and aims of her friends, and decides the fate of the evening. Granted a well-chosen company, her cares are then of the lightest description, for it is one of the purest of pleasures this harmonious mingling of minds. She has the satisfaction of feeling that she has been instrumental in enlarging the sum of social happiness; and that her home is fulfilling one of the many beneficent purposes for which homes exist. But where the company is a large one, and the diversity of mind is necessarily great, a tax is laid on her entertaining genius of a more serious kind. It is advisable to have a definite object in this case, a carefully arranged programme. This is the secret of the usual success of dancing-parties; and quite brilliant evenings may be attained in the way of private theatricals, tableaux, charades, readings, recitations, and so forth. Every circle will have its own favourite amusement. A group of people interested in literature and art become utterly oblivious of the flight of time when some hostess has done them the lasting service of bringing them together. And this is no less true of those who derive their enjoyment from music. But pleasant as such specialistic evenings are, it is conceivably a most necessary thing that wider sympathies be engendered by a mingling of tastes. Goethe says that a man learns to think too much of himself when he shuns society; and so it is with exclusive companies. Be the company what it may, however, in this respect, the hostess will find that the measure of success will be in exact proportion to the thought she has expended. As she sows, so shall she reap, even to the exact quality of her seed-thought. It is no affair of chance, as some entertainers seem to think.

In the matter of introductions there is room

for much nicety of judgment. 'If I introduce two people to each other who have much in common, and so give mutual pleasure, I feel I have done a great and lasting good,' said one lady; and the truth of her remark will be readily admitted. People who have nothing in common will be sure to misunderstand one another; and the profit will be more readily expressed by minus than by plus. 'I should have died a miserable man,' says Vogler, 'had I been forced to leave the world before I found these two'—referring to his meeting with Weber and Meyerbeer; and surely we can go no farther than that in talking of the use of fortunate introductions.

Too much thought is expended on the physical, too little on the mental entertainment, is the dictum on all hands. Money is expended lavishly on food and drink, and too often the mental nourishment is scanty or non-existent. Some hostesses believe their duty lies only in the commissariat department; and certainly there are too many who are well pleased if the viands are choice, and who care for little else. They are like the lady Mrs Hawthorne met on a voyage to Cuba, who discovered there was a litter of pigs on board. She pursued the captain with requests for 'von leetle peeg' for dinner until he was wearied into acquiescence. The evening 'von leetle peeg' adorned the table found its admirer arrayed magnificently in silk and lace for the momentous occasion. She seated herself beside the captain, who began to carve the dainty morsel. But alas! just at that moment the vessel gave a lurch, and over slid piggy, gravy and all, into the too-fond lady's lap. Tradition says that she ate it all, but never asked for another!

To live low and think high is as apt a motto for social entertainments as it is for the conduct of daily life. Dickens has caricatured this for us, as he caricatures most things, in Mrs Bayham Badger's entertainments. 'Every Tuesday evening there was lemonade and a mixed biscuit for all who chose to partake of those refreshments. And there was science to an unlimited extent.'

Yet to provide a feast which shall fulfil all the desired requirements is no light task. A good hostess, whether consciously or unconsciously, seeks to charm all the senses of her guests. The fragrance and colouring of her flowers, the brightness and sparkle of her crystal and silver, contribute no less to their entertainment than the viands on her table. But, as botanists tell us that weeds always grow in the wake of cultivation, so there are sundry weeds grow in the wake of entertainments. There is the modern disease of indigestion. How many can trace the beginnings of their misery to the partaking of unsuitable food at the houses of their friends! No hostess should allow on her table anything that is likely to do harm to her guests, even though it may give pleasure at the time. It is quite possible to provide dainties which are a delightful refreshment, yet which are fraught with no painful consequences. In breaking a law of nature, there may be a momentary sweetness; but the compound is

peculiarly scanty, and the after-flavour is bitter indeed. It forms a good test of an entertainment, this study of after-effects. Does it leave a good taste in the mouth, literally and otherwise? Is it the kind of entertainment we should look forward with pleasure to enjoying again?

To busy men and women, it is lamentable the waste of time involved in fulfilling what are looked upon as social obligations. Life is too short to read any but the best books, we often hear; and if so, it is too short to be spent in any but the best company and in the best possible way. It often happens that the best company does not lie in what is strictly one's own social circle, nor are the most entertaining of entertainments necessarily those of the class to which one may belong. This must, of course, be regulated by individual taste and individual need, for what may be a refreshment to one may be a weariness to another; but most will allow that, as a rule, we are victims to what Ruskin calls the 'frightful conventionality of social habitude.' It certainly must be a matter of grave concern to all who believe themselves to be their brothers' keepers, this present inefficiency in our social life to keep and hold its younger members from seeking their amusements in more questionable paths. Is it not possible to have warm, bright, social evenings, the atmosphere of which will not stifle, and which will be strong in vitalising and attractive power? It is surely not a hopeless ideal this of a society which shall help and stimulate, while it provides recreation for those who need it. Social circles which so fulfil the end of their being do exist, and from their entertainments each may go away saying: 'I always feel better after such an evening. Life seems nobler, more full of purpose, more worthy of one's highest efforts.' Such an ideal evening is described by George Meredith in *Diana of the Crossways*. The occasion is a dinner at Diana's house. 'They rose from table at ten, with the satisfaction of knowing that they had not argued, had not wrangled, had never stagnated, and were digestingly refreshed; as it should be among grown members of the civilised world, who mean to practise philosophy, making the hour of the feast a balanced recreation and a regeneration of body and mind.'

Great service has been done in the worlds of art, music, and letters through the stimulus found in the salons of Paris and the courts of Germany. Society cannot make geniuses; but it can do much to foster their talents and stimulate their energies. Much of the finest work of Haydn and Schubert, we can safely say, would never have been accomplished but for the fostering care of the Esterhazys; and Wilkie, Haydon, and many a young artist owed a deep debt of gratitude to the encouragement and kindness of Sir George Beaumont. Haydon, the artist, sketches for us a day at his country-seat in Leicestershire: 'Sir George painted, and Lady Beaumont drew, and Wilkie and I made our respective studies for our own purposes. At lunch we assembled and chatted over what we had been doing, and at dinner we all brought down our respective sketches, and cut up each other in great good-humour.' What could be more delightful than this realisation of Schumann's words: 'In every age there is a secret band of kindred spirits. Ye

who are of this fellowship, see that ye weld the circle firmly, so that the truth of art may shine ever more and more clearly, shedding joy and blessing far and near.'

A SOLDIER AND A GENTLEMAN.*

CHAPTER XIII.—WHAT CAME OF THE SIGNING OF THE SETTLEMENTS.

'He's mad, of course,' thought Sir William, as he stood and looked after Ferrers. 'But men don't do these things. He can't think of staying in the house an hour after this. I've seen the last of him, then; and now I've only got to manage Dolly. Perhaps it is as well that he is gone.' So he struck across the park towards the plantation to find Dolly. He had just entered the shade of the trees when he saw her walking towards him. He hurried to meet her.

'My dear Dolly,' said he, 'what has this man been upsetting you with?'

'Upsetting me, uncle?' said Dolly, looking certainly composed, if not apathetic. 'I'm not upset. But you say, "this man." You admit, then, that he is not my cousin?'

'Your cousin? No; except in so far as all the descendants of Adam and Eve are cousins. That was but a practical joke for a certain purpose, which I want now to explain to you, my dear. —Come,' said he, 'and let us walk up and down in this cool place, and I'll tell you all about it.' He tried to take her hand to put in his arm; but she withdrew it, and stood looking at him.

'Why,' she asked, 'did you wish to play your practical joke on me?'

'On you, my child?' exclaimed Sir William in some astonishment. 'I've not played it on you; I've played it—or have meant to play it—on your trustees, on Drew and Drumly.'

'How can you say that,' she demanded, 'when you set him to behave to me as if he were my cousin, and got me to treat him as if he were? It was unkind and shameful of you, uncle—shameful!'

Sir William bit his nail, and considered his niece with a worried and critical look. 'Was it, my dear?' said he. 'I am very sorry—very, indeed. But you must know that, if that has been the result, it has been entirely owing to a miscalculation: you must know I never could mean any indignity or—or shame to you, my child. Sheer miscalculation, believe me. And I'm not surprised that I should miscalculate, when I had so much to think of. The matter is indeed more serious and even desperate than I have led you to suppose.' He turned aside, as if to wipe a tear from his eye, and out of the corner noted with gladness that the girl's generous heart was moved to something of compunction, if not of pity.

'What is serious and desperate?' she asked.

'You are a good girl, and a clever girl, Dolly,' said he. 'Let us walk gently along here, and I'll tell you in a few words the whole business. I have always meant to set it before you; but the necessity for doing it has come rather sooner than I expected. You know your father, my

brother, was always proud of the family name, and of this old family place.—You are not listening, Dolly.'

'Yes, uncle,' said Dolly, bringing back her eyes from a distant gaze, 'I am.'

'Well,' continued Sir William, 'one of his reasons for going into the banking business was, at first, to make money to help to set the house up again; for we have long been poor. But after a while we quarrelled, he and I; perhaps it was my fault; I daresay it was. I was in debt here, and he wouldn't help me with his money.'

'Wouldn't help you with money?' exclaimed Dolly. 'That seems very unlike my father: he always gave me more than I wanted.'

'Ah, that was different, my dear. He gave me none; and the consequence was that I had to mortgage the estate for a certain sum (mortgage, my dear, means that the right to possess the estate has been given over in pledge or security for the sum of money I borrowed; so that if at a certain time the money is not paid back, the person that lent the money comes and takes the house and estate), and that has gone on till the estate is mortgaged "up to the hilt," as people say, and if I cannot pay it off by the 31st, house and estate and all are lost.'

'And other people will own this place—this wood, and the park, and the farms—and come to live in the dear old house? Oh, how dreadful! And father knew that that might happen?'

'Er—no,' said Sir William; 'I never told him of the mortgages.'

'But you'll pay the people, won't you, and not let the place go?'

'I can't, my dear—I can't! And that's why I am telling you all this. Your father would not help me with money; but he was still proud of the family name, and wished to keep it up. Now, I had only a son, and he had only a daughter—your own self; and his plan was that you and my boy should marry: you would bring the money, and he the estate; and so the family would be set up again.'

'Yes, uncle, I know all that,' said Dolly.

'And you were brought up to look forward to that.—Are you listening, my child?'

'Yes, uncle. But I don't see what that has to do with your curious joke of introducing to me as my cousin a man who is not my cousin.'

'I'm coming to that, my dear. Your father had one reservation—an important one—about your marriage. He believed that marriage between cousins is unfortunate unless they are quite healthy people; because of their relationship, you understand, my child. Now, he got it into his head that my boy, your cousin Will, was not so heartily strong as he would like him to be, though he thought he might be all right as he got older. So before he died, he instructed your guardians, Drew and Drumly, not to sanction the marriage unless they were satisfied of the good health of your cousin. For a long while, as you know, your cousin has been away to grow strong; but he is not yet all that he ought to be.'

'I know,' Dolly astonished her uncle by declaring. 'I saw him this morning.'

'You saw him this morning?'

'I did not know at the time that it was he; but I know now. I only saw him at a distance.'

'Well—as you probably saw, my dear,' said Sir William—'he is very nearly as well as anybody need be, though I should not like to show him to your guardians for a month or more. Now you understand why, in my desperation, I let the man Ferrers introduce himself to them as William Dawlish.'

'No,' said Dolly; 'I don't understand.'

'Look here, my dear,' said Sir William. 'I'm in this desperate and deplorable fix: the estate, the house, and everything must go, on the 31st, if the mortgage be not paid; my only chance of paying it off is by your marriage with your cousin being—not celebrated, but sanctioned; and that sanction your cousin is not ready to win from your guardians. I find, then, a man who is like enough to your cousin to pass for him among people who have not seen him for years, and who is strong and healthy enough to win the sanction by merely showing himself.'

'Still, I don't understand,' persisted Dolly. 'How does the sanction give you money to pay the mortgage?'

'Surely you know, my dear,' said Sir William, 'that as soon as your guardians sign the sanction of your marriage, you have command of all your father's money to do what you like with; while you are recommended to apply a certain part of it to buy back the parts of the Dawlish estate that long ago were lost.'

'I shall have command of all my father's money?' exclaimed Dolly.

'You, my dear, and you alone. And,' continued Sir William, 'I know that you are as fond of the Dawlish estate, and as proud of the Dawlish name, as your father was, or as I am.'

'Is the Dawlish name,' asked Dolly simply, 'something to be very proud of?'

'Surely, my child. And you would not let it, or the Dawlish estate, be lost, would you?'

'I should not like to see other people—strangers—living here.'

'Well, then, my child: it all depends on you. Your guardians are bringing down the papers this afternoon, and will sign the sanction, and hand over to you the control of the money.'

'That means, uncle,' said Dolly, stopping and looking in Sir William's face, 'that you have arranged that my marriage with my cousin shall be settled this afternoon; and that then, as soon as I have in that way got the right to my father's money, I shall pay off your mortgage. You have arranged all that without asking me?'

Sir William looked uncomfortable and somewhat foolish; decidedly the girl had more business faculty than he had imagined.

'I did not wish to trouble you about it. Besides, my plan would not have worked smoothly with you before your guardians if you had known it, and then I thought that as soon as you knew it, and the desperate necessity for it, you would be sure to fall in with my arrangements.'

'That was rather rash of you, uncle,' said she, 'to suppose that I should have agreed with you that there was a desperate necessity for my being played with and put to shame by a strange man.'

Then Sir William was seriously alarmed, and he endeavoured somewhat awkwardly to appease her. "'Put to shame," my dear! Surely not,' said he. 'At any rate there can be no more of it, for the man has had his reward, and is gone.'

'Had his reward?' exclaimed Dolly, flaming with resentment. 'Do you mean the money you promised him?'

'Er—yes,' said Sir William.

'And did he really take it?' demanded Dolly with flashing eyes.

'He did. Why not?' said the baronet. 'He is only a common low fellow, and'—

'He is not a low fellow!' exclaimed Dolly, turning on her uncle. 'And if he were, it does not say much for my cousin, since you set the one to represent the other.'

To that Sir William had nothing to say. Dolly walked on, and he kept beside her, perplexed beyond measure. Did she, or did she not, care at all for the 'low fellow?' In either case, it would be better he should avoid the subject. For him, the great matter was to win her to his purpose, and he saw no way of doing that but by appealing again to her generosity, and (perhaps) to her regard for the family honour.

'Well, Dolly, my child,' said he, 'you see I am at your mercy—I, the house, the estate and all. What are you going to do with us?'

'Why,' said she, 'do you not let the sanction alone at present, and tell Mr Drew or Mr Drumly the truth about your mortgage, and ask them for the money?'

'Ask them for the money?' Sir William laughed. 'Do you imagine, my child, that I have not thought of all these things? They would not lend me, much less give me, a penny. There is, believe me, no way but the way I have taken; and if you do not join me in it, now at the last, then I am ruined, and the Dawlish name and the Dawlish estate are both lost!'

'If I had the money, you know I would give it you at once. But I cannot—I will not—to-day promise to marry any one! I will not be hurried into marriage, or into a promise of marriage. I have not even been asked yet!'

'That is not Will's fault, poor boy,' said Will's father. 'He is pining to see you and to talk to you. And then there is no attempt or desire to hurry you, my child; the marriage need not come off for a long while; indeed, if you find, when you really know each other, that you bitterly object to it, it need not come off at all. The immediate necessity is this sanction, which is just as much as saying in a formal way that you *may* marry. God knows, it is not for myself I humble myself and appeal to you. It will be no benefit to me to get the mortgage paid off; I am a pretty old man, and I cannot last very much longer.'

'Don't say that, please,' said Dolly, impulsively laying her hand on his arm, while Sir William wiped an imperceptible tear from his eye.

'All I want is to leave the Dawlish name and the Dawlish place to those who come after me—to you, my dear, and your cousin, I hope.'

'What do you want me to do, then?' she asked, clasping her hands in resignation.

'Only this, my dear—only this,' said Sir William; 'say nothing about your discovery that that man is not your cousin, and appear

when I call for you to see the sanction signed, and to put your own name to a paper of settlement which will give you the control of your father's money.'

'Very well,' said she in cold resignation.

'My dear,' exclaimed Sir William, grasping her hand in thankfulness, and offering to kiss her, 'you are an angel!'

'No, I'm not,' said Dolly. 'And I'd rather—please—not be kissed now. I'd like to walk up and down here a little in the shade, if you don't mind leaving me alone.'

'Certainly, my girl,' said her uncle; 'but don't be late for lunch.'

So they parted; and when Sir William had disappeared, Dolly went back to the little hollow and sat down. She was miserable exceedingly, and her heart burned with shame and resentment. For a brief while after Ferrers had left her she felt that she had been wantonly hard and cruel to him; but now that Sir William told her that he had taken money—money!—for the unworthy, the shameful part he had played, she could not endure the thought of him. How utterly mean and despicable it was in him to do that, especially after all he had said to her. Probably he was now on his way back to London, with his pocket full of gold, laughing to himself at the absurd girl he had had a scene with. With flaming cheeks and flashing eyes, she smote her hands together, stamped her foot on the ground, and left the hollow and the plantation, and returned to the house.

In the meanwhile, Ferrers was not gone. After his violent ebullition of temper with Sir William, he came to himself a little, and considered that on the whole it was foolish to utter such threats as he had hurled at the baronet; it would be wiser and more to the purpose to devise some way of circumventing his designs. The immediate necessity for him was to prevent, if possible, any pact of marriage between Dolly and the lunatic and cretinous William Dawlish. Drew and Drumly had gone to town on some such business, he believed, and some time that day, he suspected, there would be something like a formal signing of contracts. He did not see how anything could be done in proper form without the presence of one William Dawlish or another, yet he thought it well to wait and watch. He resolved, therefore, that he would not go away until he knew that Sir William's trick was abortive, or until he had seen Drumly and set before him the whole matter.

When he reached the house, he went straight to his room and stayed there. From his window he saw Sir William return from the plantation, and by-and-by Dolly, and he argued that it looked well for his own purpose that they came separate, and not as those who were agreed. He did not, of course, go down to lunch; he lay on his bed to pass the time, thinking of all that had come and gone since he had entered on this adventure. He had no sense of hunger, but his brain was on fire, and he was consumed with thirst. He drank all the water in his carafe, and was beginning to drink from his ewer, when a tap came to his door. He said, 'Come in;' when there entered the man Murphy, whom he had seen the night before in charge of Mr Daw-

lish. He bore in his hand a tall tumbler containing a foaming drink.

'Ye'll excuse me, sorr,' said the man; 'but I knowed ye was here, and ye won't mind me, for I know all about it, and this is a sorra black house to be in. Ye've ate no victuals, that I know, and the thirst must be upon ye, and this is just the thing for ye. Divvle a thing is there in it but a dhrop av the craytur, and limmon juice and sody-water. It's just what they're for callin' a limmon squash, if ye'll excuse me.'

'Thank you,' said Ferrers; 'I'm very much obliged.'

He drank it greedily, without stopping to consider the good faith of the Irishman.

'I musn't stop wid ye,' said the man, taking the empty tumbler; 'the barranite might find me out, bad luck to 'im! Ye'll excuse me, sorr.' And so saying he departed.

Ferrers was refreshed and stimulated by the drink, inasmuch that he walked up and down his room to allay his restless desire to be out and acting; but presently he became unconquerably drowsy; so he lay down upon his bed and fell asleep.

How long he slept he could not tell; but when he came thickly and vaguely to himself, and looked about him, he saw by the long shadows that the afternoon must be far advanced towards evening. He sprang from bed, and accused himself of dereliction of duty. Probably, Drew and Drumly had arrived from town, and perhaps the fatal moment for Dolly had already passed! He strode to the door. It was locked on the outside! Then he guessed that it was intended he should be kept there, and that probably for that end the drink had been sent to him. He was infuriated. He rushed to the window—it was but one floor removed from the ground, but the height was considerable—he clambered out without hesitation, and, clinging first to the window-frame and then to the window-sill and a contiguous limb of ivy, which was torn from its embrace of the wall by his weight, he swung himself down. He alighted on a flower-bed and fell to a sitting posture, and before he could recover himself two pairs of stout arms were upon him. But he was too old a soldier to be completely caught by an enemy at unawares. Quick as thought, he guessed the situation: the papers were being signed somewhere at hand, and Sir William had tried to ensure his absence, first, by the prepared drink; second, by locking him into his room; and third, by telling off two men to lay hold of and secure him should he have the hardihood to escape by the window. That explanation flashed in order upon him as soon as he felt himself laid hold of. He kept himself together till the men, thinking they had him, bore carelessly off their grip, when, shooting out one foot and getting the other well planted, he swung out his arms with tremendous force, flung his assailants off, and sprang erect. Then he turned to see who they were, and recognised them as the man Murphy and the Irish-American. If they were on the watch for him there, he thought, the great crisis must be passing in some room accessible from the garden, and what room could that be but the library, in which he had already had two adventures? He rushed to its French window which, he observed, stood open. He was on its

threshold when he saw, in one glimpse, Drew and Drumly seated at the table with papers, Sir William leaning over opposite, and Dolly stooping in act to write.

'Stop!' he shouted, when his assailants again flung themselves upon him. He was in a fury of rage. He gripped them by the throat, one with either hand, as a man of common height and strength might grip two Dutch dolls, banged their heads twice together, and flung them away. Then he strode into the room, and encountered a strange look of mingled shyness and wonder from Dolly. That look inexplicably thrilled him with a reckless pride in his strength, so that for the moment he felt a strong desire to return into the garden and pound the two men together till they were limp and worthless. But he did not.

'What—what—what is the meaning of this?' said Mr Drew, in a soothing tone. 'You've been upset, eh? with the hot sun to-day. Sir William told us you were lying down to get rid of the feeling.'

'Sir William,' said Ferrers, 'is a liar. I never had a touch of sun in my life. But I am a liar, too; I have been acting a lie!'

'Bless me!' exclaimed Drew, pale with wonder, while Drumly sat silent, and grimly sorrowful; and Sir William with a look and gesture aside endeavoured to signify that no notice should be taken of these wild words.

'I am quite aware of the meaning of what I say,' continued Ferrers, 'and I beg you'—looking at Drew and Drumly—'to listen to me. You are sitting here, I believe, to arrange or to settle a marriage between Miss Dawlish and William Dawlish: that is no business of mine except in so far as I have come before you as William Dawlish. My name is not Dawlish, and I am no relation of the Dawlishes.'

'You did not, then,' said Drumly, 'sign this paper a few minutes ago?'

He showed Ferrers a signature—'William Dawlish'—at the end of a sheet of writing.

'No,' answered Ferrers; 'I did not write that.'

'What is your name, then?' asked Drew.

'George Ferrers.'

'Humph! "G. F.,"' said Drew.—'Go on, sir.'

'I have little more to say,' continued Ferrers. 'At Sir William Dawlish's request, I introduced myself to you as William Dawlish; and all the rest has followed from that. And, though the marriage is no concern of mine, you must allow me to say this that you will regret it, and Miss Dawlish will regret it, if you let anything be arranged until you have seen and spoken to the real William Dawlish, whom I saw and spoke to last night for the first time.'

'Where did you see him and speak to him?' demanded Drew.

'In this house,' answered Ferrers.

'In this house!' exclaimed Drew, and glared at Sir William, who stood a monument of rage and despair.

'I am sorry,' said Ferrers, 'I ever had to do with the shameful business. I will make no excuses for myself,' he continued, with a glance at Dolly, who sat with heaving bosom and averted eyes; and if you wish to punish me, I am ready to submit.'

Drew looked at Drumly, and Drumly looked at Drew and shook his head.

'No, sir,' said Drew; 'there is no need for a scandal. The best thing you can do is to go away and let us hear of you no more.'

'Very well,' said Ferrers; 'I shall go at once. I only ask permission to go first to the room I have been occupying to put on my own clothes; I do not wish to keep anything that has been bought with Sir William Dawlish's money, or that might remind me of this.'

Drew and Drumly looked at Sir William, who gave no sign; so Drew nodded to Ferrers in token of assent. Ferrers was crossing the room to go out by the door when Dolly spoke.

'I should like,' said she, looking at her guardians, 'to ask Mr Ferrers one question—Did he to-day receive money from my uncle?'

'Money!' exclaimed Ferrers. 'I would not accept a shilling from Sir William Dawlish!'

Upon that reply, the guardians looked at their ward.

'That is all,' said she.

So Ferrers went out, his heart bursting with this fresh indignity, which he thought Miss Dawlish had put upon him, and at the end of a few minutes—during which those in the library kept their positions in silence—he appeared crossing the gravel sweep, in an old tweed suit and with a small paper parcel under his arm. They watched him walk away down the drive towards the gate, till he was hidden by the trees.

BRASS AND BRONZE.

BRASS and Bronze are two alloys of copper. The first is composed of copper and zinc; the latter, of copper and tin. Both historically and scientifically these two compound metals are of greater interest than almost any others. Copper was one of the first metals discovered, extracted, and utilised in the earliest periods of our history; and antiquaries are accustomed to speak of a 'bronze age' to express that interval of time during which this metal formed many of the implements used for industrial purposes and in warfare.

Bronze, spoken of in the Bible as brass, is of very ancient origin. We have little or no notion how the ancients got copper; but in all probability large quantities were formerly found in the metallic state, just as we find it now in the neighbourhood of Lake Superior in America, and Baikal Lake in Siberia. This would only have required melting to yield a tolerably pure metal. If, however, they smelted copper from its various ores, it is difficult to realise how they could overcome such a complicated process; and we can only admit that in this respect, as in so many others, the ancient people of Europe were very much cleverer than we moderns are apt to believe.

The word copper is generally admitted to be derived from *Cyprus*, as it was from that island that the ancient Romans first procured their supplies. In those remote days Cyprus and Rhodes were the great copper districts; and even in our own day new discoveries of copper ore,

especially the beautiful blue and green ores—from which the metal is so much more easily obtained than from the copper pyrites and other sulphuretted ores of Cornwall—are being made nearly every year in the islands of the Mediterranean. Many of the numerous islands which are dotted over the Grecian Archipelago, on some of which we have telegraph stations, seem capable of supplying considerable amounts of copper ore, if the roads in these mountainous districts were such as to ensure a comparatively easy transport. Unfortunately, in most cases this is not so; and where mines have to be made, roads have also to be constructed, which of course makes the undertaking very expensive.

The ancient Syrians and Phœnicians are well known to have been active traders in copper, and they manufactured this metal into bronze by melting it with tin. Learned antiquaries assure us that the Phœnicians actually came to England and to Ireland in search of tin for this purpose; and a few years ago, some curious bronze articles were found in several of the old mine-workings in Cornwall, which are believed to have been left there by that ancient people at a time when no bronze was either made or used in England.

The word 'alloy' is employed in chemistry to signify the combination of one metal with one or more others. For instance, brass is an alloy of copper and zinc; bronze is an alloy of copper and tin; German silver is an alloy of copper, zinc, and nickel; pewter is an alloy of lead and tin, &c. These alloys have given a great deal of difficulty to scientific chemists, and even now it is not certain whether they are definite chemical compounds or mere mixtures. In some cases, indeed, they appear to be fixed compounds—that is, always presenting the same composition, or containing the same weight of each of the metals; and some can be obtained in the form of crystals which invariably present the same composition. But when we come to consider the alloys of copper and zinc, as well as those of copper and tin, we find that there exist a considerable number of them containing variable amounts of each metal, and differing very widely in their properties. For instance, an alloy of forty parts of zinc with sixty parts of copper represents a kind of brass which will very well serve certain purposes in the arts, such as the sheathing of ships; but it will not answer for other purposes which require a brass containing, say, twenty-eight parts of zinc and seventy-two parts of copper.

We know some two dozen of these alloys of copper and zinc, differing in colour from gray and white to pale yellow, golden yellow, and reddish yellow, and possessing very different properties as regards resistance to strain, filing, turning, polishing, melting and casting, rolling, hammering, wire-drawing, &c. There is a kind of German brass containing nearly equal portions of each metal; it is yellow like other kinds; but it cannot be drawn into wire, and it cracks under the rollers. Seventy-five parts of copper and twenty-five parts of zinc give a pale yellow brass very fit

for rolling; sixty-six parts of copper and thirty-four of zinc give an alloy which is very good also for rolling, hammering, and wire-drawing. It is a very ordinary kind of brass, largely used throughout Europe and America.

Great art is requisite in making these alloys. It is true that they are readily formed by melting the two metals together in a crucible or in properly constructed furnaces; but it is necessary to ensure perfect fusion and to prevent loss of zinc, which is a volatile, inflammable metal, and easily catches fire. Indeed, it is not at all uncommon to find that two alloys of exactly the same component parts differ very materially in properties, in consequence of a difference in the mode of preparation or in the care bestowed upon it.

A metal resembling brass, but said to have been superior in quality, was known in England as 'maslin' as early as the time of Chaucer; and in the reign of Henry VIII. an act of parliament was passed prohibiting the export of brass out of England. Whether the earlier monumental brasses still to be found in our churches were made originally in England is not absolutely certain, the probability according to some antiquaries being that they were of French or Belgian workmanship. Queen Elizabeth invited Daniel Houghstetter and Christopher Schultz with a number of German workmen to come over and instruct our men; and a regular brass-foundry was at last opened in the year 1565. Another started about a century later at Esher, in Surrey, where it ultimately failed. But the celebrated Prince Rupert erected other foundries, and from his time brass-founding progressed rapidly. Brass cannon were cast at the Temple Water-mill works at Hackney, and foundries were established in Bristol and Birmingham. The latter city, which is now the principal seat of the industry, made more than ten thousand tons of brass in the year 1835, when the rolling-mills and foundries of Phipson, Pemberton, Muntz, and others were beginning to become famous. The yield in Birmingham now is above fifty thousand tons per annum.

The composition of English brass is about seventy parts of copper and thirty of zinc. 'Prince Rupert's metal' contains seventy-five to eighty per cent. of copper, and on account of its golden colour is employed to some extent in Jewellery. The kind of brass called 'tombac' contains still more copper, nearly eighty-five parts in a hundred. It is the alloy used for the manufacture of what is called 'Dutch metal,' an imitation of gold-leaf: it can be rolled into sheets, and these can be beaten out till they have only the fifty-third thousandth of an inch in thickness.

It is a curious fact, which has hitherto puzzled the most clever philosophers, that common brass which is subjected for some time to constant tension occasionally undergoes a remarkable change: it loses its tenacity, and in a short time becomes almost as brittle as glass.

When the metal nickel is substituted for part of the copper in making brass, we get a compound metal, or alloy, known as German silver. The Chinese were acquainted with it ages ago; they called it *pakfong*, or white-metal. It is susceptible of being rolled into very thin plates, and of taking a high degree of polish. There are about

a dozen different kinds, in each of which the proportions of the three metals differ more or less, and these differences cause very wide variations of quality. The kind most commonly used contains about fifty-nine parts of copper, fifteen of nickel, and twenty-six of zinc.

Bronze is another compound metal in which copper is alloyed, not with zinc or nickel, but with tin. Curiously enough, it was known to the ancients under the name of brass, and they made many of their tools and implements of war with it before iron came into general use. It melts much more readily than copper, and is used in making coin, medals, cannon, bells, and statues, as well as in various ornamental work. Bell-metal contains about seventy-eight parts of copper and twenty-two parts of tin; gun-metal is formed of ninety parts of copper and ten parts of tin. The bronze of which statues, lamp-stands, &c., are made often contains some lead and zinc as well as tin.

It was the celebrated artist, Lysippus of Sicyon, who discovered the art of moulding bronze into statues, although rough castings of bronze had been made long before his time. But it was this discovery which fostered the rage for statues in the time of Alexander the Great. It is said that the Roman consul Mutidnus found no fewer than three thousand bronze statues at Athens, and about the same number at Rhodes, Olympia, and Delphi. In later years they were spoken of by Pliny as 'the mob of Alexander.' But it appears that Lysippus did not make more than six hundred bronze statues in all.

We read in Homer's *Iliad* that during the Trojan war the combatants had no other armour than that made of bronze. On turning to Latin authors, it is very evident that the Romans did not know accurately the difference between copper, brass, and bronze. They often confuse the three names. They seem to have considered brass a more valuable kind of copper, and used the word *æs* indifferently to denote either. They called copper *æs Cyprium*, and afterwards only *Cyprium*, which in time became modified to *Cuprum*. In the middle ages it was not generally known how to distinguish gold from brass, and the latter was a useful substance in the hands of the wily alchemist.

A very hard white bronze, composed of two parts of copper and one of tin, is used for making the mirrors of reflecting telescopes. It takes an exceedingly bright polish, and the late Mr Nasmyth said it can be improved by the addition of a small quantity of arsenic.

About the time that Joseph and William Phipson, of Birmingham, discovered that zinc could be rolled when heated to a certain temperature, and made considerable improvements in the art of rolling brass, the celebrated French chemist D'Arcet found out how the Turks and Chinese made their cymbals and gongs. These are also a kind of bronze or bell-metal composed of copper and tin; but after the metal has been cast into moulds, it is heated and plunged, whilst hot, into cold water. It can then be hammered by virtue of the 'temper' it has thus acquired, and so made into those highly sonorous instruments. If you look at a gong, you will see that it has been hammered, which it could not have been without having been previously subjected to this peculiar

treatment. Before that discovery was made, gongs and cymbals were imported at much cost from Turkey, and were looked upon in Europe generally as great metallurgical curiosities.

DEAREST IS DEAREST.

CHAPTER II.

It was a very ghastly sight when the old man rose in his bed and looked round him. His face had not a particle of colour in it, and his eyes retained the fixed look which they had borne a minute before. Yet it was evident that he saw, for he cast a glance round him upon the tapers and emitted a ghostly sort of chuckle from his dry lips. 'J. G. D., you're dead!' he croaked, in a voice that had little human about it. 'That's how it is, J. G. D.; you never were bested—never; and so it was only fair to give you a chance to come back and let your nephew have your last words.—Sit down, Charles; sit down, and write; and, mind you, all I am saying now is as true as the gospel, for I'm dead!'

In spite of his common-sense, the clergyman half believed him, his voice and actions were so painfully like those of a galvanised corpse. But Charles Dardas coolly seated himself at a table by the bedside, and put paper and ink before him, as if the act of writing a dead man's words from dictation were too common to call for comment.

'That's right, Charles,' said the old man approvingly. 'Now, put down what I tell you. Pat Farrell is not to have the rent of the moneen reduced, for he's well able to pay it; and so is Tim Higgins to pay his. As for Tom Cox, he is worth nothing, and he may go. Those Midland shares you must hold on to, for they will go up before long.—Have you all that down?'

'Stop! stop!' cried the Rector, who had recovered his senses a little. 'Consider, Mr Dardas; you may only have a few minutes more to live, and will you spend them on these earthly affairs? I entreat you to let me offer up a prayer for you, that the Almighty may have mercy on you even at the eleventh hour.' And the good man fell on his knees by the side of the bed.

'Up with you, out of that!' screeched the old man. 'Don't I tell you I'm dead! And is it for a Protestant parson like you to be praying for the dead?—Go on, Charles! He's a fool, but you are not; and you'll know the value of a message like this from a dead man!'

The young man had raised his eyes curiously, at the Rector's appeal. When he heard his uncle's answer, he smiled rather bitterly, but did not utter a word. He now resumed his writing in a mechanical fashion. The clergyman prayed on half audibly, trying to relieve his soul from the oppression that weighed it down in the presence of these two automata.

'Write!' commanded the old man again. 'Those brand canal shares are going down; best sell them at once. The Widow Murphy cannot manage the farm alone; you must evict her and put a "warm" man into it. I am leaving you a fine property; see that you have added to it when you die, or my curse will follow you. Don't you ever be bested by any man. J. G. D. never was bested! J. G. D. never—was'—His voice

had been getting fainter and fainter, and he now sank back on the pillow, and his jaw fell.

The young man rose and again carefully felt his pulse. Then he turned to the Rector, who still remained on his knees, praying. 'It is over now, sir,' he said quietly. 'He is really dead at last!'

The clergyman rose to his feet, staggered to a chair, and buried his face in his hands. 'How awful!—how awful!' he said. 'Oh Mr Dardas, will you not take warning from this? Here is a soul gone into the presence of its Maker without one thought of repentance—not one—occupied to the very last with the world and its devices.—Lord! Thou wilt not require this soul at my hands?'

'You are a good man!' said Charles Dardas, looking at him curiously. 'I wish I had known you before.'

'It is never too late!' cried the Rector, taking his hand earnestly—'never!'

'I fear it is in my case,' said the young man carelessly. 'However, we shall see. Can I offer you a glass of wine? It will refresh you after the painful scene you have gone through.'

'Not in this house—not in this house,' answered the Rector. 'I will walk home—you need not trouble to drive me; the walk will do me good.' And without waiting for the guidance of his host, he hastily redescended the stairs and hurried through the open door into the night.

Once outside, he heaved a sigh of relief. The sky had cleared at last, and a pale crescent moon was shining. The calm moonlight was the same relief to the eyes after the yellow glare of the tapers that the peace of the night was to the troubled mind of the Rector. He stood for a few minutes with his hat off taking in the calm of the scene, and then turned his steps homeward.

Outside Ballinalack he was met by a crowd of men, women, and children, armed with lanterns and sticks. Mr Dardas' servant had brought so wild an account to the village of how the devil had got into her master's corpse, that the whole population—distrusting the powers of a Protestant minister to exorcise the demon—had turned out to assist in the pious office. They had captured the 'jockeyman' of the village, who had a great reputation for circumventing witches and disenchanting churns; and being in sufficient numbers to keep up each other's courage, they were making good progress towards the haunted house. It was rather a disappointment to most of them when the Rector explained to them the facts of the case. Some of the old women went on with the servant to assist in laying out the corpse; but the majority of the crowd retraced their steps to Ballinalack, and had a fresh drink all round in the public-houses whilst they discussed the news.

Meanwhile, in the old house, Charles Dardas sat alone with the body of his uncle. When the Rector left him, he had drawn a chair to the bedside and gazed long and intently on the dead face on the pillow. There was little love or regret in his glance, rather a look of resentment and hatred, which imparted a sinister expression to his countenance, very unusual to it. After a while, he sighed wearily, and went to the window, against the cool glass of which he leaned his hot forehead. The party of old women

coming up the dark avenue took the pale face illumined by the bright background for a real and veritable ghost, and this time it must be confessed that they were not far wrong. However, after the first moment of fright, the maid-servant recognised her young Master, so they took courage and went in.

Two days later the funeral was held, and the lawyer from Mullingar read Mr Dardas' will, which had been entrusted to his keeping. It left all the property of the deceased, real and personal, to his nephew, on the one condition that the latter should, within two years from the date of the testator's death, marry a woman with a dowry of at least five thousand pounds sterling. If this condition were not fulfilled, the property was to be sold, and the proceeds handed over to the trustees of the Adelaide Hospital in Dublin.

'You will not have much trouble in carrying out the condition,' said the lawyer, smiling, as he folded up the parchment. 'With a face like yours, and a fortune worth at least twenty thousand pounds, you will not have much difficulty in finding an heiress. I must congratulate you on your good fortune. I hope you will still continue to give me the benefit of your legal business?'

'Certainly,' said the young man abstractedly. The provisions of the will had evidently come upon him unexpectedly, and he was turning them over in his mind. 'It is a curious will,' he said, after a pause. 'I wonder why my uncle inserted that condition?'

'Well,' replied the lawyer, 'at this time of day you will forgive me for saying that Mr Dardas was a "close" man, and did not like to part with anything without an equivalent. I suppose he valued *you* at five thousand pounds, and did not choose that you should throw yourself away for less. A very good example of his "nearness" in money matters is, that he made out this will himself without consulting me—in order to save my fee, no doubt. As a natural result, he has composed a document which lends itself to evasion with the greatest ease. For, let us suppose that you want to marry a penniless girl—and here he looked hard at Charles Dardas from under his eyebrows—'all you would have to do would be to settle five thousand pounds upon her by deed of gift, and then she becomes an heiress within the terms of the bequest. If I had been consulted about the will, I would have inserted clauses which would effectually have stopped up that loophole. But as I had neither part nor lot in the matter, I am quite ready to give you any assistance in my power to evade the condition, should you find it at any future time a restraint upon your liberty.—Good-bye, sir; I rely on your promise to employ me; and, with a smile, the lawyer departed, congratulating himself on having done a good day's work, and laid the foundation of much profitable business. For his car-driver was a friend of Biddy Moran's, and had given the man of law a hint of how matters had stood between the dead man and his heir, which hint the lawyer was quite capable of expanding and acting upon.

When he was left alone, Charles Dardas went to his own room, and seating himself at his desk, began a letter, which was evidently not an easy one to write. Sheet after sheet was begun, only

to be torn up and consigned to the waste-paper basket. At last he saw that he had come to the last sheet of note-paper in his secretaire, and that if he spoiled this, he would be unable to continue his letter without a fresh supply from Ballinalack. So, setting to work desperately, he wrote on, not daring to read what he had penned, lest he should be driven to destroy it.

'MY DEAREST MARY!' he wrote, 'I wonder what you will say when you receive this letter, and realise that it is in my handwriting. I do not think you will throw it aside unopened; you are not cruel enough for that! I am free at last, Mary! If you only knew what that means to me. I have fulfilled my share of the bargain—I have finished my slavery, and now I have gained my reward. My uncle has left me the whole of his property, valued at about twenty thousand pounds, on the one condition that I marry within the next two years a woman with a fortune of five thousand pounds. I was terrified when I heard the condition; but my lawyer advises me that it is easily to be evaded by a deed of gift making over the required sum to the girl I love. So that now nothing stands in the way of our marriage. I myself will give you your dowry of five thousand pounds, and it will be yours for ever, to spend how you wish, and to leave to whom you like.

'You have too much good sense, I am sure, to reproach me with my conduct of late years, although you did not answer my last letter. You know that my uncle insisted on my breaking off our engagement and ceasing our correspondence, as a condition of his making me his heir. And you know how impossible it would have been for two people like ourselves to marry without money. Surely, then, I took the wisest course, and you understand that I did. We can marry now, with a good competence, and live happily for the rest of our lives. You will find plenty to do here, for the people are semi-savages, though affectionate enough in disposition; and the house and farm need much to be done to them.

'Perhaps you may still be angry with me, Mary; but you *know* you love me as I love you. I rely on your love, and I am sure I shall not find it wanting. Just send me a line to fix the day, and I will have a deed of gift drawn up and present it to you with my own hands in Dublin. I shall be so lonely here, till you come!—Ever your loving

CHARLES!

He closed the letter without reading it, and put it in his pocket, intending to walk out to the village and post it. But he had not foreseen the curiosity of Biddy Moran, who caught him by the arm when he appeared at the door of her post-office, and insisted on his coming indoors to tell her all about the poor Master's last moments. Charles Dardas was, at bottom, kind-hearted, and had a liking for Biddy, so did not care to hurt her by a refusal. She was profuse in tears and blessings and good wishes for him.

'There was some,' she said meditatively, 'who thought to call in Tim Healy, the jockeyman, to cure the ould Master. And sure if any one could have cured him, it would have been Tim.—Does your honour know little Pat Geoghegan, the baker's son? Last Christmas he got a terrible

falling of the roof of the mouth, and he could take neither bite nor sup; so they called in Tim. "Musha, then!" says he when he sees him, "that's aisy cured!" And with that he gets on a chair and takes Pat by the hair of the head, and lifts him up off the ground, and he kicking and striving to squeal, for all the world like a pig when they are ringing it. With that, flhop goes something, and the roof of his mouth came up again, drew up off his tongue, like. And he was well at wanst. Oh, Tim is a great doctor entirely! I wouldn't wonder, now, if he had cured the ould man. But maybe if he had, yourself wouldn't have been too well pleased, for he led you a hard life of it, Master Charles!'

Charles Dardas had laughed heartily at the Irish version of a practical cure for quinsy, but at Biddy's last words his face darkened, and he addressed her impressively.

'See here, Biddy! Let me hear no more of that. My uncle was kind enough to me, whatever he was to other people, and I'll not hear a word said against him, now he is dead. You may just let the Ballinalack people know that. I am ready to do the right thing by them if they act fairly by me. But if I hear of any stories being told about my uncle, or me, or my affairs, I will let them know that I can be as hard a landlord as ever they had. Do you understand me?'

'Av coorse, I do, sir,' said Biddy humbly. 'And shure, when all is said and done, the ould Master was as good as the rest of us. God rest his soul! I never asked better than to live with him till himself turned me away.'

Charles smiled, and went out, posting his letter as he did so. Miss Moran always made a point of reading the addresses of the correspondence that passed through her hands, before handing it over to the mail-cart. When she saw a letter addressed in Charles Dardas' handwriting to 'Miss Mary Davidson, Rathgar Road, Rathmines, Dublin,' she formed her own conclusions, but judged it safer not to communicate them to any but two or three of her especial cronies, who, with her, waited eagerly for an answer.

It came by the return mail, and was forwarded with some other letters to the Dardas mansion by a special messenger—the very Pat Geoghegan of the 'fallen palate,' who had strict injunctions to watch the young Master while he read it and see how he took it. But this well-meant attempt at espionage was frustrated by Charles Dardas, who put the letter in his pocket when he received it, and carried it to his room for private perusal. Pat, however, was equal to the occasion, and having been promised a penny if he succeeded in his commission, composed a telling narrative of how 'the Master was struck all of a heap like, and turned as white as a sheet,' &c. The inventive power displayed by him was quite worth a penny, and he duly earned it.

Charles Dardas sat and looked at the envelope a long time before he opened it. To tell the truth, he was far from being so confident of the answer of his sweetheart as he had pretended. He had serious doubts, deep down in his own heart, of the course he had pursued, and though he had succeeded in making his own conscience pretty comfortable, he dreaded that of a woman, whose insight into the principles of right and wrong may easily be argued into silence, but

is not so easily convinced as that of a man. At last he broke the seal and began the letter.

'DEAR CHARLES,' it ran. 'You say that you know I love you! Well, I own it; it is true. I do love you, and I always shall. In *that* nothing you have done or can do will ever make any difference. In this letter I am going to try to put things clearly between us, for at any cost truth is best, is it not?

'Knowing that I love you, you ask me to condone your sacrifice of me, for the sake of money, and your breaking of our engagement. I think, Charles, my love is so strong that I can do that too! But then, you ask me to share in the wealth that you have acquired by your sacrifice—and, more than that, to assist you in evading the conditions on which you acquired that wealth. You ask me to receive a bribe of money—to sell myself and my self-respect for a home, a vocation, and a few thousand pounds. That, Charles, I cannot do.

'Let us put love aside, and reason the matter out on the practical grounds which you think superior. You deliberately gave me up, years ago, rather than lose your chance of inheriting your uncle's fortune—though for that fortune you might have had to wait ten, nay, twenty years. I did not reproach you then, and I will not now; but oh! Charles, how can you expect me to trust myself to you now, when I have learned by experience that you love money more? I *could* not do it. I should always have in my mind the feeling that money was more to you than I was. It would be a profanation of the sacred tie of marriage.

'And then, again, you know my views of right and wrong. If a man's will means anything, it means an expression of the wishes of the dead, which, to my mind at least, are as binding when written down in a document without a signature, as when embodied in the most legal form. You ask me to help you to evade the dead man's wishes—nay, to run flatly contrary to them—for you must see that that condition was expressly intended to bar your marriage with me! And yet you would take his money! Charles, I cannot believe that you would do this yourself, if only you think it over.

'And yet, I own again that I love you; and what is more, I believe that you love me, in spite of these past years. You are young, strong, well educated, a man to make your name in the world. If I understand you, the income of the property is yours unconditionally, for the next two years. Use it to start yourself in a profession; you are sure to get on. Let those two years be the time of our real betrothal; and at their end, when all that money, which has a curse upon it, is gone from you, we will marry and live as best we can. I shall not be afraid to trust myself to you then! No! I shall be able to look up to you as my husband, to admire you as a noble man who has preferred love and righteous dealing to money. Oh Charles, if you knew how I hope and pray that you may be guided to do this!—if you knew what a woman's love is, and how it longs to see its object standing high above his fellow-men—a hero who can be worshipped as well as loved!

'Think before you write again, and, if you

have not forgotten how to pray, pray earnestly on the matter before you decide, for you are deciding the happiness of two lives, and perhaps—I speak it with all reverence—the future of your own soul! After all that I have said, you will understand me when I sign myself as in bygone days—Ever your loving
MARY!'

Charles Dardas' face had grown darker and darker as he read. When he had concluded, he deliberately tore the letter into four pieces and put them on the blazing turf in the fireplace. The paper curled, shrivelled, and then flamed up, and flew in the fierce blast up the chimney. He watched the last fragment disappear, and then turned and left the room.

GIBRALTAR FOR TWENTY CENTURIES.

MAJESTIC Gibraltar, the sleepless sentinel of the Mediterranean, rears its beetling front sheer from the depths of the ocean. To the ancients it was an object of awe and veneration; to the moderns for twelve hundred years it has been a bone of contention and a coveted possession. It has experienced fifteen memorable sieges, and its history in great measure centres round those successive conflicts—a stirring record of capture and recapture, siege and countersiege. But our minds have been so occupied with the history of its later sieges, that we are apt to regard Gibraltar as an eighteenth-century product. This would be a grievous error; for, long before the days of good King Alfred, Gibraltar had a history at once eventful and romantic.

Gibraltar has been known since the days of the Phœnician navigators. In the primitive geography of the early Greeks and Romans it was Calpe, and formed one of the renowned Pillars of Hercules, that for centuries were believed to be the western boundary of the habitable globe. The twin pillar was Abyla, a lofty eminence on the African side near Ceuta.

The rock is situated at the extremity of a low sandy peninsula, and is formed of Jurassic limestone on a Silurian base. It is three miles in length, of an average breadth of three-quarters of a mile, and is about seven miles in circumference. It attains its greatest height in O'Hara's Tower, fourteen hundred and eight feet above the sea. The signal station is twelve hundred and fifty-five feet in height. Outlined against the evening sun the rock as a whole presents the figure of a lion couchant, with its head turned towards Spain. Nor in form alone is it the symbol of the king of beasts. Its teeth are those murderous batteries that bristle on every part of that giant 'head,' and its roar is the thunder from their thousand iron throats.

We have no certain information that Gibraltar was recognised and employed as a place of strength before the eighth century of our era. But in 711 A.D. the Saracen leader Tarik-ibn-Zeyad, a general of the Calif Al Walid, crossed from Africa for the invasion of the kingdom of the Visigoths. He was at once impressed with its strength and strategic importance. Accordingly, he fortified it both to form a base of operations and to afford a ready means of access from the African coast. From the leader, Tarik, the place was named Gebel-el-Tarik (Tarik's Hill),

a corruption of which gives us Gibraltar. Thus the 'lion' passed into the hands of the Moors; and for eight hundred years the banner of the Prophet floated over it in spite of the valour and enthusiasm of the Christian warriors.

The first siege was in 1309. In that year it was taken by Alonzo Perez de Guzman for Frederick IV. of Spain. He, like Romulus of old, endeavoured to attract inhabitants to the place by making it an asylum for thieves and murderers, and by granting exemption from import or export duties.

In 1315 Gibraltar was besieged for the second time. Ismail ben Ferez brought up his forces and strove to make himself master of it. But he was unsuccessful. However, no long respite was allowed the garrison. The third siege began in 1333. Vasco Paez de Meira, the governor, had suffered the fortifications to decay, and the numbers of the garrison to be seriously diminished. Thus, when it was attacked in force by the army of Mahomet IV., king of Fez, it was compelled to capitulate. Scarcely was the capitulation an accomplished fact, when the fourth siege was set afoot. Alfonso, king of Castile, strove to recover his lost possession. His attack was indeed valiant and determined, but at the same time useless and unsuccessful. He was at length fain to raise the siege, and content himself with a tribute for the rock from Abdul Melek of Granada.

Alfonso was indeed baffled, but not disheartened. In 1344 he attacked Algeciras with success, and was encouraged once more to try his fortune on Gibraltar. Thus came the fifth siege of the rock. In 1349 he invested it in strength; but in 1350 he was carried off by the plague, and so the siege came to an untimely end.

There was now respite from siege for a period of sixty years; but in 1410 there was another struggle for the coveted possession. Again it was lost and won. Yussuf III., king of Morocco, succeeded in wresting it from the king of Morocco. This was the sixth siege.

Once more the Spaniards determined to oust the infidel, and again laid siege to the rock, and the seventh siege was begun. The commander of the attacking forces was the Spanish Count of Niebla, Enrico de Guzman. The attempt was an utter failure, and proved disastrous both to the general and to his forces.

Soon, however, a brighter day dawned for Spanish chivalry and pride. In 1462 the fortress was invested by a hostile force for the eighth time. The Christian warriors again drew the leaguer of battle round the devoted rock. Their leader was Alonzo de Arcos; and in August, Gibraltar was finally wrested from the Moors, and the Crescent was replaced by the Cross. Thus, after a lapse of eight long centuries, the fortress passed once more under the Christian sway, and under it has remained since that day.

At last the Spaniards had won that proud possession, for which they had striven for hundreds of years; but they were not to be permitted to enjoy it in peace. And, strange to say, the enemy on this occasion came from within, from themselves. The Duke of Medina Sidonia, a powerful grandee, had assisted at the capture of the rock. When it was at length won, he was seized with the desire to possess it for himself. Ferdinand IV., his king, naturally was

opposed to this, and for some time was able to maintain the claims of the Crown. The Duke, however, was not to be baffled, and appealed to arms. After a struggle, he succeeded in making himself master of the place. Thus Gibraltar was besieged for the ninth time.

The king was now fain to make a compromise. Accordingly, in 1469, he declared the son and heirs of the Duke governors of the rock for ever. In 1479, Ferdinand and Isabella made the second Duke Marquis of Gibraltar; but in 1492, Don Juan, the third Duke, was allowed to retain possession of the fortress with great reluctance. A stronger step was taken in 1501, when Garcilaso de la Vega was ordered to take possession of Gibraltar in the name of the king. It was then incorporated with the rest of the Spanish dominions. Naturally enough, Don Juan was not disposed thus tamely to yield up a possession of such honour and power. He assembled a force, and added a tenth to the long series of sieges already recorded. Needless to say the attempt was a failure.

Peace now reigned over the silent 'lion' for thirty-four years. It was the calm before the storm. An enemy terrible indeed was soon to encircle the rock with his fanatic hordes, flushed with conquest and success. The pirates of Algiers had sworn to plant the Crescent once more upon the rocky summit. The struggle was fierce and bloody; but the torn and shattered followers of the Prophet were forced to quit the field. Thus closed the eleventh siege.

Spain was now in the height of her power and prosperity. Her sons were vigorous and high spirited. Great efforts were therefore made to refortify and strengthen Gibraltar in every way. Their exertions were conspicuously successful, and the fortress was considered throughout Europe as impregnable. This belief was, however, dispelled in 1704, when Sir George Rooke, with a combined English and Dutch fleet, and assisted by a body of troops under Prince George of Hesse-Darmstadt, planted the British flag upon its battlements. After a vigorous bombardment, they landed in force and carried the fortress by assault. Through unaccountable oversight, the Spaniards had allowed the garrison to be reduced to the perilous number of one hundred and fifty men. Such, then, was the twelfth siege.

No sooner was their proud possession lost to them, than the Spaniards realised their insensate folly, and determined to recover it at all hazards. Accordingly, before the captors should have time to strengthen the fortifications, they invested it by land and sea. Gibraltar was captured by the British on the 24th of July, and on the 13th of October the siege was begun. The Spanish fleet was, however, dispersed by Sir John Leake. On land, their forces experienced no better fortune. The Marquis of Villadarias fared so badly that he was superseded by Marshal Tesse. Even he could not command success; and in 1705 he was compelled to raise the siege.

During the subsequent twenty years there was cessation from hostilities. Instead of attack and defence, negotiations during all those years were conducted for the peaceful surrender of the fortress. At last, in 1726, the Spaniards had recourse to arms, and the fourteenth siege was soon in progress. The defence was conducted

under General Clayton and Lord Portmore. It was splendidly effectual. On the 23d of June an armistice was agreed on; and although the war dragged on for two years longer, the siege was practically at an end. The Spaniards thus baffled in negotiation and in arms, were forced to endure what they could cure neither by might nor counsel.

Gibraltar now enjoyed peace for half a century. Seldom, indeed, had the great fortress been so long free from strife and conflict. Then the clouds began to gather, and the storm burst with a fury that shook the very Pillars of Hercules themselves. The fifteenth siege of Gibraltar, known as the Great Siege, was rapidly closing in upon the devoted garrison. Britain was in the thick of a desperate struggle with her revolted American colonies. In 1778, France had acknowledged America as an independent power. This naturally led to a declaration of war against her. Spain took the opportunity to join the hostile coalition, and at once made a most determined effort to recover Gibraltar. Their plan of operations was a blockade. They therefore invested it by land and sea in the strictest manner, and by cutting off all supplies, strove to reduce the place by famine. They had very nearly succeeded, when Admiral Darby contrived to bring the long-looked-for supplies and reinforcements. The Spaniards were mortified to have success thus dashed from their grasp. The blockade was made stricter than ever, and none might come forth from the rock nor enter into it. Once more success seemed near. The garrison were in dreadful straits—a fact quite well known to the besiegers. To the utter confusion of the Spaniards, however, almost at the last moment the topsails of a mighty armada rose above the horizon. It was the British fleet. Strong men wept for joy as a hundred sail of their native land swept proudly into the bay, laden with everything that the hearts of famine-stricken men could desire. They were convoyed by a gallant show of Britain's men-of-war—the dreaded 'wooden walls,' for those were the days of Nelson and Trafalgar. The Spaniards were now totally exasperated, and turned the blockade into a siege. The blockade had commenced in June 1779, and now, in 1781, before the unloading could be finished, a terrific bombardment was opened upon the place.

In July 1782 the Spaniards were reinforced by the French. Preparations were now made for a grand assault. A powerful fleet was assembled round the battered rock. Their chief hope, however, was ten floating batteries designed by D'Arcon, a French engineer. Ten Spanish battle-ships were sacrificed for these. Their tall sides were cut down, leaving but one deck, on which were planted the heaviest known ordnance. With such skill were they constructed as to be deemed invincible.

Meantime, the garrison within were not passing their days in slumber. They saw only too well how dreadful would be the conflict, and strained every nerve to combat their opponents. 'Old Elliott,' the grim old Scot, was the life and soul of the fortress. His means of offence was in all seven thousand men and eighty guns. Furnaces also were prepared for a constant supply of red-hot shot.

On the 13th of September the final struggle began. The Britons within were ready; and even before the great batteries had quite come into position, the red-hot iron shower poured fast upon them from above. Soon it was answered from every part of the hostile line. The scene was indescribable. Travellers have told us the horrors of a tropical thunder-storm; but no tropical thunder-storm ever shot such lightnings and thunderings. Four hundred of the heaviest guns were blazing and crashing at the same moment. The shock was tremendous. The very earth seemed to rock and tremble under the incessant discharge. All through the day the conflict raged. Night settled down, 'and still Elliott's guns thundered defiance from the rock.' By one o'clock, two of the floating batteries were a prey to the flames. By morning, nine out of the ten 'invincible' batteries were destroyed, together with a great part of the fleet. Every resource of power and skill had been employed in vain; and although the blockade lasted on till February 2, 1783, the contest was recognised as over. Elliott and his eighty guns had indeed given a good account of themselves; and the old war-worn veteran was rewarded with a peerage, and became Lord Heathfield.

We are so much accustomed to think of Gibraltar as a fortress that we are apt to overlook the fact that it is besides a considerable town and a flourishing seaport. It has been a free port since 1705. Its total population numbers some twenty-five thousand, including from five to six thousand soldiers. The governor exercises all the functions of the legislative and executive, and is always an officer of experience and ability. For the purely local business of the town there is a Board of Sanitary Commissioners. The whole community is, however, regulated by military usage. This arises greatly from the circumstance that the gates are opened and shut precisely at gun-fire morning and evening.

Gibraltar is the strongest British garrison abroad, and costs from three to four hundred thousand pounds yearly. No wayfarer may sojourn in Gibraltar without a pass from the Town Major. If he desires to prolong his stay, he must find a consul or householder to be responsible for his conduct. Permits are granted for only short periods—ten, fifteen, or twenty days. They can, however, be renewed.

THUMB NOTES.

WERE it left to the ladies to decide the relative importance of the five fingers, the pride of place would certainly be accorded to the fourth finger, as the bearer of the outward sign of wifehood. Granting that honourable privilege to be sufficient to entitle the fourth finger to rank above its fellows, it is a question if it rightly enjoys the privilege. It has been contended that the master-finger was originally the recipient of the badge of matrimony, chiefly, if not entirely, on the evidence of Tom D'Urfey and Samuel Butler—the first-named writing of a courtship so fast and furious that

Ere three days about were come,
The ring was put upon the thumb;

and Butler decrying the abolishing of

That tool of matrimony, a ring,
With which the unsanctified bridegroom
Is married only to a thumb.

But then he goes on :

The bride to nothing but her will,
Which nulls the *after-marriage* still ;

which may be read to mean that the thumb-ringing ceremony was merely the preliminary one of formal betrothal. In the other case, it does not follow that if the ring was put upon the thumb, it stayed there ; since the old marriage ritual prescribed that the ring should be put upon the thumb at the words, 'With all my worldly goods I thee endow ;' placed in turn upon the second, third, and fourth finger, on which it finally remained.

Southey tells us that in the time of the first two Georges, ladies transferred the wedding-ring to the thumb after the ceremony, and that it is represented so worn in portraits of the period. He might have gone farther back. The heroine of Southern's *A Maid's Last Prayer* declares of a lover : 'Marry him I must, and wear my wedding-ring on my thumb, too, I am resolved ;' from which it may reasonably be inferred that to do so was rather the whim of the few than the habit of the many. Portraits of Elizabethan dames wearing their wedding-rings upon their thumbs are said to be extant. Possibly the rings were not wedding-rings, ringing the thumb being an old feminine fashion. It was upon that member of the hand Chaucer's Canace carried her wonder-working hoop ; and a mummy-case in the British Museum bears a representation of an Egyptian lady, the thumbs of whose crossed hands are each encircled by a ring. In the days of Queen Anne, according to the *Spectator*, the feminine thumb-ring was the badge of widowhood ; and women tired of single-blessedness were wont to don it, and, as 'jolly widows,' achieve conquests denied to them as spinsters.

Men's thumb-rings are no rarities to collectors. Some of the Roman specimens must have been cumbersome wear, one in the Montfaucon collection, bearing the bust of Trajan's consort, Plotina, measuring over three inches across. Mediæval churchmen of high degree did not allow 'the largest, first, and shortest of the fingers' to go unadorned. A massive gold ring was found upon the thumb of the supposed skeleton of Hilary, Bishop of Chichester, who died in 1169 ; and the recumbent effigy of Bishop Oldham, in Exeter Cathedral, is remarkable for the pressed-together thumbs being enclosed by a single ring. When the shrine of St Thomas à Becket was robbed of its treasures, the famous archbishop's thumb-ring, given to him by the king of France, graced with a ruby the size of a hen's egg, found its way to the thumb of bluff King Hal ; and as the humour of the king is always voted just the thing, we may be sure the royal hand was not the only one so decked at court. Mayors and aldermen imitated their betters. 'When I was about thy years, Hal,' says the Fat Knight, 'I was not an eagle's talon in the waist ; I could have crept into an alderman's thumb-ring ;' and that the wearing of thumb-rings was pretty general in the seventeenth century is proved by Brome's remark that a good man in the city carried nothing rich about him but the gout and

a thumb-ring ; and for an example nearer our own day, it may be noted that Dr Thomas Chalmers wore a thumb-ring once belonging to his great-great-great-grandfather.

Would-be hypnotisers should avoid trying conclusions with persons possessing longer-jointed thumbs than their own, for, if there is any truth in palmistry, the strength of one's will depends upon the formation of the thumb ; the will-power of its owner being great or little according to the length or want of length of its upper joint. How the thumbs of Roman holiday-makers were formed mattered nothing to the defeated gladiator, whose fate hung upon their being bent forwards or backwards ; a method of decreeing life or death to which, perhaps, we owe a man at another's mercy being said to be under his thumb. The Irish hero, Fingal, had the felicity to be under his own thumb, that member serving him as a danger-signal, aching in a peculiar way whenever trouble impended, when he had only to put it in his mouth to become immediately instructed how to overcome the difficulty of the hour. So, by the pricking of her thumbs telling her 'something wicked this way comes,' did the weird sister know of Macbeth's approach before her ears caught his footfall.

When a new member was initiated into the Westphalian Vehmgerichte, and swore to keep the secrets of the society from wife and child, father and mother, sister and brother, from fire and sword, from the things warmed by the sun or nourished by the rain, he did so with the thumb and two fingers of his right hand upon the cross hilt of a sword. An oath so taken was held irrevocable, and not to be annulled by even the Pope himself. In olden times, it was the pressure of the thumb upon the wax of a document's seal that made the deed a valid and binding instrument, and in verbal contracts the thumb ratified the bargain. Goths and Iberians completed an agreement by licking and joining their thumbs, as Scotsmen once did, and Moors still do ; and rustic lovers once betrothed themselves by licking their respective master-fingers and then pressing them together, as they vowed to remain faithful to each other for ever and a day. Even now an Ulster man signifies his assent to a proposition with, 'We may lick thooms upo' that !' if he does not suit the action to the word like the lieutenant, who, in 1642, on being challenged to mortal combat by his own sergeant, accepted the duel by licking his thumb, saying, 'There is my parole for it.'

If Henry IV.'s popinjay envoy had not excited Hotspur's wrath by the way he manipulated his pouncet-box with his finger and thumb on Homildon field, the king might have got his prisoners for the asking, and valiant Sir John lacked the chance of boasting he had slain Harry Percy after fighting a long hour by Shrewsbury clock. Had the mincing courtier intended to raise the ire of the 'Mars in swathing clothes,' he would have pocketed his pouncet-box and bit his thumb at him ; as Capulet's servitor Sampson bites his at Montague's men—'a disgrace to them if they bear it ;' when, as they do not incline to let the insult pass unresented, swords are crossed ; blows, swashing and otherwise, exchanged ; until the enraged citizens joining in, there is as pretty a street fight as could be desired. Shoulderings,

jeerings, and biting of thumbs were the favourite provocatives to quarrel with the 'roughs' of St Paul's Walk in Shakespeare's time, and many a braggart brawler bit the dust for biting his thumb at a better man.

Ingoldsby's vulgar little boy much shocked his benefactor when he 'put his thumb unto his nose and spread his fingers out'—a derisive bit of pantomime in vogue among the ancient Assyrians. More elaborate was Panurge's method of 'taking a sight' at Thaumaste. Lifting his right hand in the air, he put the thumb to his nose, holding his four fingers, straight out and closed, in a parallel line; then lifting his other hand, and stretching forth its fingers and elevating the thumb, he held it in a line with his right hand, a cubit and a half in front, and abased towards the ground both the one and the other hand. The glib-tongued street-boys seem now to have given the go-by to this time-honoured declaration of contemptuous defiance in dumb-show, preferring to give vocal expression to their sentiments.

To say a man works by rule of thumb is to reproach him with inexactness; but when Exchequer tallies were in use, a notch the width of a thumb represented exactly ten pounds. When drapers employed the clothyard wand, the possession of a narrow thumb was an advantage to an aspirant to the counter, as in measuring goods the buyer gained a thumb's width in every yard; but the adoption of a measure imbedded in the counter deprived slim-fingered ones of their advantage, and the draper's customers of their 'thumbs.' It is by the thumb the miller tests the character and qualities of the grain he grinds; spreading the sample over the fingers by a peculiar movement of the thumb, he gauges its value by the thumb itself. Continual action in this way makes the thumb assume a shape resembling the wide flattened head of the bull-head or Tommy Logge, a fish prevalent in mill-streams, which in consequence is popularly known as the Miller's Thumb.

Cornelius Ketel painted his pictures with his thumb, and it is still the picture-cleaner's safest tool. When sewing was rendered easier by the invention of the thimble, or thumbell as it was originally called, that useful article was worn upon the thumb, not the finger; and the Japanese dentist, disdaining any but Nature's appliances, finds his thumb and finger all sufficing in the extraction of the most stubborn of aching teeth. Recounting the performances of a company of 'barn-stormers,' the *Connoisseur* says: 'I was much diverted at Sir Harry Wildair, whose chief action was a continual pressing together of the thumb and forefinger, which, had he lifted them to the nose, I should have thought he designed as an imitation of taking snuff; but I could easily account for this singular gesture, when I discovered that Sir Harry was no less a person than the dexterous Mr Clippet, the candle-snuffer'—without whom, Goldsmith tells us, a play would lose half its embellishments. According to an epilogue writer of the seventeenth century, it was then easy to distinguish the country from the town gallant in a theatre; the latter being known by putting his periwig in order with a comb, while his provincial brother was content to attain the same object with four fingers and a thumb.

A Chilian merchant used to defy forgery by placing one thumb on the paper he wished to sign, and tracing its outline; then he placed the other thumb across, outlined that, and his signature was complete. An impression of the thumb in ink would better serve the purpose, for we have Mr Francis Galton's assurance that the patterns made by the cuticle of the fingers do not vary so much between various periods of life, nor alter sufficiently by reason of other conditions, as to lose their individuality. The Chinese have long been aware that the impressions of no two thumbs, even of the same individual, are alike; and impressions of every criminal's thumbs are taken by the police and numbered for reference. He may disguise himself as he will, make up as he can; but a comparison of the impressions of his thumbs with that in the police archives settles the identity of an old offender beyond doubt. Had such a means of comparison been available in the famous contest for the Tichborne estates, certain believers in the Claimant would have had no excuse for plaguing the then Home Secretary by petitioning him, in the event of that worthy dying before the expiration of his sentence, to order his malformed thumb to be amputated and placed in the British Museum, 'to enable posterity to judge of an important matter connected with the Tichborne case.'

Children have come into the world sparsely provided as regards the members of the hand; some with but a thumb and index-finger, others with no thumb at all, or with hands like that of Mr Caesar, who represented Herefordshire during the last century, which was as nearly like a lobster's claw as a specimen of humanity could be expected to carry; a species of malformation he shared, according to the records of the Berlin Academy of Sciences, with a whole family of negroes dwelling near Paramaribo in 1759.

'SWEEP.'

ALCOFRIBAS, when he tells of the people who inhabited the two sides of his master Pantagruel's teeth, and who were entire strangers to each other, says: 'Then I began to think that it is very true which is commonly said, that one half of the world knoweth not how the other half liveth.' In the four centuries since Rabelais wrote, the number of ways in which the world lives has multiplied greatly. What do people generally know of 'sweep' as an article of commerce? Even if it is lengthened into sweepings, they will not be much the wiser. 'Sweep' is rubbish—the derivation of which is probably from rubbage—but it is certainly very precious rubbish. It is a technical term for refuse arising from work done in gold and silver—platinum is only a small matter—whether that refuse is got together by the broom or obtained in more indirect ways.

Forty or fifty industries at the least are dependent on those who deal in gold and silver. Goldsmiths, silversmiths, jewellers, wedding-ring makers, diamond mounters, opticians, dentists, photographers, bookbinders, glass silverers, platers and gilders, surgical-instrument makers, watchcase makers, secret-springers and polishers (for watches), boot-makers (for eyelets), bur-

nishers, pencil-makers, penmakers, brushmakers, purse-makers, cabinet-makers, wire-drawers, lace-men, button-makers, stick-mounters, pipe-mounters, and so on, almost *ad infinitum*. The precious metals are not as water that, spilt on the ground, cannot be gathered again; they are indestructible and unconvertible, and can, and actually do, find their way back—like Silas Wegg's amputated leg,—to the source from which they flowed. Walking about Clerkenwell, the stranger will occasionally come upon a man carrying what looks something like a magnified cheese-taster on his shoulder; it is meant for sampling sweep, and the man is in the employ of a sweep-smelter. Sweep-smelting is a special business, and is in very few hands. It must not be confounded with ordinary refining; native metals of course have to be smelted, but all about gold and silver ores, and the way in which they are purified, can be learned from books.

Jewellers, and those who work directly in gold and silver, save as much as they can of their valuable refuse by literal sweeping. Some nail strips of metal over the cracks in the flooring; others have more complicated arrangements, such as gratings which serve to diminish the amount of precious dust that might be carried away on the soles of the workmen's shoes. There is board-sweep, and lemel (the waste that comes of filing), and turnings (from the lathe), and punicings (from the polishing done with pumice-stone); gold-beaters have skewings, which are remnants of gold-leaf. Hand-wash of course is worth preserving, and, in fact, everything with which the gold or silver worker comes in contact. All instruments used in refining when they are worn out have themselves to pass through the fire; crucibles and ladles are sure to have gold and silver attachments. The chimneys of furnaces have their sweepings and scrapings preserved and tested. The floor of a jeweller's workroom in the course of years, and with whatever precautions against waste, makes very good sweep. Sometimes the roof of a house acquires an artificial value. Means have been used, too, to compel the smoke of furnaces, by forcing it through water and lattice-work, to drop on its way the dust of gold which otherwise it would carry into the atmosphere. Workmen's caps, aprons, boots, blouses; the rags used by book-edge polishers, are worth burning down. In the old days, when ore was ground in mills worked by horses, the overflowings of the mill so affected the accumulations without, that they were found to be too precious to be used as manure, and became sweep under the genteel name of residue. Gilt-wood, cornices, old artificial teeth, in fact almost everything that has ever had gold in it, has some sort of worth.

It is to be expected that a trade dealing in such precious materials as gold and silver will be assailed by fraud. One of the oldest, easiest, and most profitable ways of creating sweep was by what was called sweating guineas. A file and a little leather bag were all the materials needed. A plump young guinea could spare a few grains to the sweater, and go on its way rejoicing. If it had not been for the gallows, which loomed darkly in the sweater's path, some substitute for a gold currency would have had to be found. Workers in gold are not always careful in leaving the fragments behind. An employer who felt

sure he was being robbed, after much watching and investigation, noticed a workman who had acquired the impolite habit of scratching his head. It turned out that his head would have made excellent sweep. The master had some inclination towards getting at the gold by the usual refining process, but mercifully fell back on the brush and comb.

Sampling sweep wants carefully looking after. A few grains of gold-dust mixed with the sample would make a considerable difference in the price offered for the bulk. But honest dealers have grown to be at least as artful as thieves, though men differ in the skill with which they sample sweep, just as they differ in their cleverness as to other things. To know just what to offer for sweep, especially if it be of an unusual kind, is given only to one who is an old hand at the business, and has, besides, a touch of genius. 'How do you mix your colours?' the great painter was asked, and he replied: 'With brains, sir.' In every profession brains tell. To an outsider, nothing would appear more worthless than a quantity of sweep, the offer for which might reach to three figures in the pound. If it were his, he would be asking himself what was the least he must give to have it carted away.

BY THE CHRISTMAS FIRE.

A PENNY for your thoughts, sweet wife!

Across the sparkling winter rime,
With tongues that clash in merry strife,
The bells ring out their Christmas chime.
In silence by the hearth you stand,
Amidst the Yule-fire's ruddy glow,
While Memory turns with tender hand
The page we folded long ago.

You watch the footpath o'er the hill—
Our path which led to rose-strewn ways:
Dear heart, do lovers walk there still?
And whisper secrets nowadays?
Do lads and maidens thither roam,
Unmindful of the drifted snow,
To carry Christmas holly home,
Or search in pairs for mistletoe?

They said our bough seemed hard to find
Upon a certain bygone day,
Because we loitered far behind
The laughing groups that came our way.
But when the wintry sunset died,
And Night hung up the Christmas moon,
We two went homeward, side by side,
With hearts that beat one old, old tune.

Now, sons and daughters bend bright heads,
My dear, above your easy-chair,
And stoop to kiss the silver threads
Upon the darkness of your hair.
You say Life's winter has begun—
Ah, well! Its keenest winds may blow:
I keep, thank God, the love I won
That happy Christmas years ago.

CHRISTMAS IN CANTON.

CANTON at Christmas is full of the glitter and gladness of the sun ; it is like a modern Christmas card. Our trees are green, our gardens, balconies, and tables are full of roses, heliotropes, and chrysanthemums. As the days are filled with the sun, so are the nights with the moon. At sunset on Christmas eve, heaven and earth are touched with reds, greens, and yellows which would delight the minds of those who think in paint. The curious wooden junks, with their pointed brown sails and streaming scarlet pennants, move out mysteriously, manned by their yellow crews in blue cotton jackets and scanty pigtails. The birds begin to settle softly into the sighing trees on the shore, twittering lightly, a hundred at a time. The river, boats, and houses look like a sketch on the pearly inside of an old shell ; the natives, moving about in their æsthetic robes and in their tranquil way, seem well in keeping with their background. On the foreign settlement, which is a little island called Shamin, tennis is in full swing on the public lawn ; a few of the inhabitants are strolling on the bund ; others are illuminating the little church with flowers. Here are some fine avenues of trees ; and walking under them, as one looks up they seem to have caught the feet of swiftly-coming night in their dark masses ; while the half-weird light from the west is streaming on their trunks. The night spreads from the trees to the river, and fills the earth with its presence.

Now we catch sight of the Christmas moon among the trees, where, here and there, a leafless tree writes winter on the sky in the old crooked characters. On the river they beat out the watch, making a rhythmic flow of wooden music ; and in a neighbouring yard there is the gobble of a Christmas turkey. Our path under the trees has become a stream of shadows. It is Christmas eve, and we are far from home. Memories flow over our souls as the shadows over our heads : light and dark, dark and light, dancing

and passing, and yet, touching us too deeply for tears.

The moon looks upon a city which is a museum only to us until we get some heart interest in it, through knowing the joys and sorrows of some few people among the million encamped here in these low gray-brick houses, so closely packed together. In the chaos of plain tiled roofs we can distinguish the tip-tilted roofs of temples, mandarins' houses, tea-houses. These roofs are higher than others, and ornamented often with carved and gaudily-painted woodwork. Some roofs are made of glazed tiles, which shine in the moonlight, and all have skylights of oyster-shells. Here and there are spreading a few sacred trees, which are believed to be the local habitation of airy nothings. High above the low-built houses tower great square erections, looking gloomy as ancient keeps : these are the pawn-shops, the chests of old clothes.

All over the city one notices high bamboo structures with tiny huts on top, and which are the watchmen's towers. The watchman who spends the night up there is supposed to be on the lookout for fires, and to give the alarm at once with his gong. On every roof are steps, and on every step a jar full of water, to be used in case of fire. On most roofs there are wooden frames used for drying anything from a herring to a pair of trousers. Down between the houses are innumerable alleys, from which a hoarse murmur arises, and whence the lights of hurrying lanterns are beginning to gleam : these are the streets. There is a city also on the water ; thousands of boat-homes rise and fall on its muddy moonful tide. They look like fleets of old roofed-over cradles, whose interiors are gay with yellow light, red and green paint, little mirrors, brass water-pipes, trays, teapots, and all the household gear of a nautical home. When their cheery lights fall on a shadow, they show like golden stairways into its depths. There are swan-like guard-boats, with their clumsy cannon, and groups of triangular flags—their gaudy paint subdued by the moon. There are house-boats

anchored out in the stream, whose brilliance seems to overflow into the quiet night; and through their venetians one catches a glimpse of the glittering mirrors and lamps within; the crimson stuffs, and the polished black furniture inlaid with mother-of-pearl. On the decks and roofs lounge Chinese gentlemen, dressed in silk and embroidery, smoking their silver pipes, and doubtless felicitating themselves that they were born in the Middle Kingdom. Hundreds of water-peddlars, perched in the stern of their punts, move in and out everywhere crying their wares, which are piled up in front of them round a lamp—fruit, crockery, sugar-cane, &c. Here and there, gunboats are stationed, which were built for the Chinese in England or Germany. These often fly a flag in honour of the sailors' goddess from their main-royal masts; and their modern ship-shape surroundings have left the tars as grossly heathen as in their war-junks. Away in the distance are the white Cloud Hills in their 'own deep quiet.' On these hills tea is grown, and the dead of the city buried.

The foreign population in Canton, though larger than one would suppose, is after all only a slight incrustation. On one bank of the river there are four mission compounds with their chapels and schools; in one compound is a large hospital. There is also a magnificent Roman Catholic cathedral, which rises, a fine conception in masonry, above the inferior conceptions of the natives. There are two or three steamers lying up by the foreign settlement, which itself looks like a little bit of Europe moored by the Asiatic city. Though only about one mile round, it contains the residences of people of many nationalities—European, American, Indian, Japanese—and their various flags flaunt above its foliage. It was once a sandbank, conceded thus to the English and French. Now it is a park-like place, with lawns, gardens, and avenues; and to an eye which has been wandering over the native city, its houses, with their balconies and porticoes, look like white caskets. But what strikes one most on entering it from the turbulent native streets is its deep peace. Here a foreigner—a lady especially—may live for years and never hear the sound of a wheel, a postman's knock, or a street organ.

But how much better are these conditions than those under which the British merchants lived who traded here for the tea which was to fill the antique pots of our great-great-grandmothers. They were confined to a block of native houses on the river-bank, and never allowed to go a step beyond these narrow limits, so that they suffered badly from want of exercise. One of them tried to keep his blood from stagnation by riding a little native horse up and down the narrow yard behind the block. He emerged to this exciting feat every afternoon at about four; and he found after a time that a restaurant keeper whose premises overlooked the yard was letting seats at so much a head to spectators, who came from all parts of the city to see the performance.

But China is no longer the great tea-shop for Europe and America; the Western barbarian with his sharp nose has scented the teas of other hills; and the conceited shopman of the long pigtail and blue robe has lost his best

customer, though he is still patronised by that inveterate young tea-drinker, Australia.

Listen! It is midnight, and yet there are cocks crowing everywhere. Involuntarily, one murmurs:

Some say that ever 'gainst that season comes
Wherein our Saviour's birth is celebrated,
The bird of dawning singeth all night long.

The bird of dawning, however, singeth every night in China. How few here in this great Asiatic camp will celebrate that birth to-morrow!

There are wandering lights gleaming from the upper windows of the houses on the Settlement. The mothers are stealing around with basketfuls of toys and sweets, waited on by broadly-smiling 'amahs,' as they fill the stockings of their pale darlings, asleep under the mosquito nets. In the early dawn we notice how the foreign steamers have burst into tufts of green foliage during the night; and we observe coolies going from house to house with bundles of white-enveloped Christmas cards, which the house-boy will pile on the morning tea-tray and take in to the sleepy recipient. It is so pleasant, too, to get them in this far-off land, we even read the words.

The morning lengthens until the white-robed Chinamen ring out the church-going bells over junks and temples. A born missionary, whose love for humanity is only excelled by his Christian ardour, is putting on the plain surplice in the vestry; the organist, a Christian merchant, is arranging the music; painted light falls on faces and flowers in a silence through which to 'capable ears' the herald angels sing. From many a native home in the crowded city faithful families are turning out to wend their way through unsympathetic streets to their chapels. These chapels have wooden partitions running down the middle, on one side of which the men assemble, and on the other the women. The women and girls have on bright blue garments, with glittering and many-coloured butterflies embroidered on their shoes, and heavily-scented flowers stuck in their black glossy hair, with its gold and silver hair-pins and jade-stone ornaments. The minister in his pigtail, long blue cotton jacket, big spectacles, and small round cap, takes up the hymn-book, which looks like a bundle of yellow tea-papers, and opening it the wrong way round—as we should say—gives out the hymn. Familiar sounds arise which are sung from the heart, albeit *viâ* the nose. Then the lesson is read, and the good tidings rung out in the eight or nine tones of the Cantonese, and read from columns of Chinese characters, but just as clearly good tidings as ever they were in the Queen's English. During the service, native visitors begin to arrive, who are inclined to walk about and talk as they would do in their own temples.

After the service, active preparations for the feast are made. A lot of little tables are arranged in one room for the men, and in another for the women. On each table is placed a heavy lacquer tray, which contains a dozen or so of little round plates, like rows of buttons on a card, and each plate is piled with a different variety of small cake. These trays come just as they are all ready from the confectioner. To give a 'tea' here is a

very simple matter, and a cheap one. How many people? Fifty. Well, order five 'ten-people trays;' each tray will cost about a shilling, and its contents are wonderfully indigestible for the money. Oranges and tea for the fifty can be had for two or three shillings more.

Meanwhile, picnic parties have gone out on land and water. A favourite place is the White Cloud Hill. The party starts in a long line of sedan chairs with green calico covers. Tiffin is laid on the mind of some trustworthy head 'boy,' and on the backs of sturdy coolies. The Chinese 'house-boy' is a capital caterer for a picnic because he has no idea of picnic style: he lays the tiffin table in the hill temple as nearly as possible just as he would lay it in the dining-room at home. The party in chairs wends its way through the narrow tumultuous streets and through the gloomy city gate out into the open country. One may imagine that now every one would breathe freely and enjoy the scenery. But no! First of all an overpowering odour poisons the enjoyment; it is caused by the manure which the thrifty Chinaman lavishes upon his fields. Then the chairs wind through a crude South-African-like village; a little later they pass by a leper village, some of the inhabitants of which sit by the wayside begging; and then by the 'City of the Dead,' a place where there are hundreds of coffins awaiting a lucky day for burial.

When the ascent of the hill is begun, the sight of graves everywhere tends to depress the spirits. On the lower levels, ragged villages and reeking paddy-fields; on the higher, graves and temples. Such is Chinese country. Yet one gets used to graves, and as the bearers mount the steps made in the hill, one's spirits mount too. Just in front, in the bosom of the rounded heights, is a group of trees; and half-hidden among them like a carved jewel is the temple we are making for. The steps begin to get steeper, and one feels that everything now depends on the legs of the hindmost coolie. At length we arrive on the broad green shelf on which the temple is built. On one side of it is a gorge, through which flows an untutored mountain youth, as Wordsworth would call it, now crooning in some quiet spot, and then chafing against rocks which Nature, wild and mischievous everywhere, has thrown in its way. We are to tiffin in this temple; and should one have fears of hurting the religious feelings of its devotees, such fears may be dismissed at once. The man in charge is smiling blandly, and indeed tiffin has already been laid in the guest-room by the 'boys.' Reverence, the deep-eyed child of Love and Fear, does not dwell with Superstition in heart or temple.

After tiffin, the party throws its wraps into the sedan chairs and sets out to walk to a temple nearly at the top of the hill. They gather sprigs of tea in blossom, and look down on gray Canton, crouching on the banks of its broad stream. The temple at the top is known as the 'Monkey Temple.' Here there is a large image of a monkey clad in the full robes of a Buddhist priest; he is worshipped by all the devotees who visit the temple. The story is that he was converted under the preaching of a disciple of Buddha, and without waiting to take the steps usual in the evolution of Buddhists from monkeys, he became straightway an esoteric saint. The

terraces of the temple are crowded with lovely flowers.

It is time to turn homewards. People get into their chairs, and the long line of green-covered sedans winds down the mountain path on its way back to the Settlement.

'The pale purple evening' is upon us as we walk up and down flower-edged balconies weaving a sparkling and sombre tissue of Christmas thoughts. It is just cold enough to be excuse for a fire; firelight and sunset light are falling on a group in the drawing-room and on the pushed-away tea-table with its cloth cross-stitched by Chinese girls in the Italian convent. Cooks begin to be busy in their cook-houses, and boys in the dining-rooms; while their mistresses, unless unusually fussy, go out to stroll among the poetic lights on balcony or bund. Chinese men have a special instinct for housekeeping, and, like all notable housekeepers, they excel themselves upon occasions.

The silver moon is rising among beds of white cloud-camellias blowing softly in the clear sky, and while the unconcerned million around us are thinking their commonplace thoughts we begin to dress for the Christmas dinner. Papa puts on his best evening coat; mamma laces her bodice blue; and little Dorothy is having her brightest sash tied, for even she is to dine to-night. The houses on the Settlement begin to overflow with light. The hostess is in her drawing-room in graceful gown, awaiting her guests. What an interesting room it is: fantastically carved black wood, lovely old embroidery, curious and delicate china. So pretty, too: such gracefully designed chairs in bamboo, such artistic things from Japan, the land of bric-à-brac; and here in 'far Cathay' behold English comfort: deep chairs, heavy curtains, soft rugs, and a moon-lamp covered with a Japanese shade throwing tinted light on the polished floor. There is not a book in the room but albums of photos or autographs, and yet one feels that there is entertainment in its curio-filled recesses for days. There is no rumble of wheels; but the guests are arriving. Chair after chair is borne to the door by coolies in uniform; their burden is set down gently; a slender figure floats into the hall, murmuring her Christmas greetings to her host as he offers her his arm. The men arrive in companies often, present themselves to their hostess and retire—there are so many men out here! The head-boy in a long blue silk jacket, freshly shaven head, and black satin shoes with turned-up toes, and high wooden soles, throws back the folding-doors. The few favoured men for whom there is a lady offer their arms, the young and insignificant follow *en masse*. The table looks as if a picnic party of flowers had wandered up and dispersed itself among the crystal and silver. Some recline upon the cloth; others lean from the shining battlements of the centre-piece; others have seated themselves in low crystal bowers, or hidden away in the snowy folds of the napkins.

In the mission-houses, too, there are Christmas dinners, and—whisper it!—plenty of good things, if in plainer style. All the members of one mission like to gather together; and some come to the gathering from lonely country stations where they have seen no white person for months; all that, however, is forgotten under the genial smile

of Old Christmas. But out here, as elsewhere, there are hearts in which there is no joy to-night: the lonely, the unpopular. There are few of these, however. Canton is a place full of good hearts—good even to the unpopular. This old mart of tea—the intellectual and social cup—is full of sympathetic courtesy. And so in the homes of consul, merchant, missionary, and clerk, merry parties surround the flowery tables, wear their cracker crowns, and half forget that they are in the far East (or possibly thankfully remember it). A few hours later, the wreathed circle with hands crossed and clasped sings *Auld Langsyne*. Thoughts go away to friends who were with us last year—for China is a place of change—and as they are going farther still to our nearest and dearest, they are suddenly recalled by the hearty climax of the hand-shaking; then the circle breaks, and with it the charm—every one feels that Christmas is over.

A SOLDIER AND A GENTLEMAN.*

CHAPTER XIV.

'SIR WILLIAM,' said Drumly, 'would you be so good as leave us with our ward for a little?'

'Certainly,' said Sir William, 'and after that I should like to explain this matter to you.' And having so said, he went out.

When he had gone, Drumly sat up, and from under his heavy brows considered with a grave, kindly thoughtfulness the apathetic attitude and look of Miss Dawlish. Then he turned to his partner. 'Drew,' said he, 'that's a very fine young fellow: I hope no harm is going to come to him.'

Dolly glanced quickly up, with sharp anxiety and dread on her face. 'Oh,' said she, 'I hope not!'

Drumly said nothing for a moment: but his partner was amazed to see that eye of Drumly which was next him half close and open again: he would have said Drumly had winked, had he ever known him wink before, or had his solemn face permitted him to believe that he had winked then.

'Well, my dear,' said Drumly, leaning his elbows on the table and playing with one of the quills before him, 'would you mind telling us whether you had any conversation to-day with Mr Ferrers about these matters? You needn't be afraid of us, my dear, or shy with us: we are your father's friends, who are anxious to see you happy—old fellows who know the world (Drew here is an old married man, as you know, and I'm an incorrigible old bachelor), and who may be able to give you advice. Did he tell you at all how this had come about?'

'Yes; he did,' answered Dolly.

'Would you mind telling us the facts of the case as he put them?'

So Dolly related 'the facts of the case' as barely as she could, laying unconscious stress upon the, to her, shameful fact that he had undertaken the adventure for money.

'Will you forgive me, my dear,' said Drumly, 'if I ask whether you spoke to him warmly about that?'

'I did,' confessed Dolly, and blushed violently. 'Indeed, I think now I said many harder things than he deserved.'

At that moment there came an interruption. The pony-chaise swept up, and Lord Debrett jumped out: he had just returned from town. Seeing the library window open and people sitting within, he entered. He stood and looked round upon the three, and on the papers on the table.

'Not intruding, I hope,' said he. 'But I fancied I passed at the end of the avenue Mr—er'——he hesitated.

'Mr Ferrers?' suggested Drumly.

'Ferrers?' said Debrett. 'Well, yes; Ferrers. There's been an *éclaircissement*, then, I suppose?'

'Yes,' said Drew, 'and Mr Ferrers is gone.'

'Gone!' exclaimed Debrett. 'Then, by Jove! I go too!—Don't take that away,' he shouted to the man in charge of the chaise. 'I'll wait it.—Excuse me,' said he, turning alternately to Drew and Drumly, 'but you shouldn't have turned him out in such a hurry. You should have heard the whole story. He's a capital fellow—the best fellow in the world; and this lark was not his doing. It was Sir William's idea, and I led Ferrers into it, and I persuaded him the other day to keep it up, when he began to think it looked fishy.'

'And how fishy it is,' said Drumly, 'I don't think a gentleman like you, my lord, can have guessed. If you will give Mr Drew a moment, I'm sure he will be glad to give you the real facts of the lark.'

Drumly made a sign to Drew that he wished to be alone with Dolly, and Drew rose and went out by the open window to explain the case to Lord Debrett.

'Dolly, my dear,' said Drumly as soon as they were alone, 'I want to tell you something about myself, if you will let me.'—Dolly merely signified her assent and attention by fixing her eyes on him.—'When I first came to London,' said he, 'many years ago, I was very poor, so poor at one time that I did not know where to get food—not even a crust of bread.'

'How dreadful!' exclaimed Dolly, all sympathy.

'One night,' continued Drumly, 'I went out of the little lodging I had. I was faint with hunger. I had had no food at all that day, and scarcely any the day before. I was passing a restaurant where many people were going in to dinner. As I was near the door, almost mad with the desire for food, a cab dashed up and a gentleman jumped out. In pulling out his money to pay the cabman he dropped a shilling which rolled over the pavement close to me; I put my foot on it. The gentleman quarrelled with the cabman about his fare, and made a to-do about the money he had dropped, so that a good many people gathered. Hidden by them I picked up the shilling, and went and spent part of it on a supper of bread and cheese. Now, that seems to you perhaps a mean, dishonest thing to have done?'

Dolly said nothing, but her eyes were fixed on him.

'But, my dear,' continued Drumly, 'you have never missed a meal, unless you may have been unwell, and you have never wanted for a shilling.'

[* Copyright reserved in the United States of America.]

You have no idea how hunger may make you desperate, how it may make you hate those who are well fed, and how it may tempt you to do things you would otherwise shrink with shame from. Mr Ferrers told you he was poor, did he not? when Sir William made him the tempting offer.'

'He said he was poor—poorer than I would believe,' answered Dolly.

'Yes,' said Drumly; 'I thought so. He was probably starving, though he was too proud to tell you so; did not perhaps know where he was to get his next meal.'

'Dreadful—dreadful!' exclaimed Dolly, wringing her hands. 'And I said cruel things to him!—cruel, cruel, cruel! Perhaps he's going back to London to starve now! I'm sure he has no money!' She rose to her feet, but in a moment sat down again, and burst into tears, saying: 'What shall I do? What shall I do?'

'Here is the pony-chaise outside. Suppose,' suggested Drumly, 'we drive after him—you and I—and ask him to forgive us for being so hard with him. It may cheer him up, and perhaps he will not be too proud to take money from me.'

'Oh yes,' she cried. 'Let us go at once.'

Drumly limped to the window and said to Lord Debrett that, if he would not object, he wished to have the pony-chaise for a while.

'If you have really a regard for Mr Ferrers,' he added, 'you will wait here till I come back. You can help me to make things look better.'

To his partner he gave the short but sufficient explanation that he was going to take Dolly for a short drive to soothe her nerves.

'Now,' said Drumly, when he had returned into the room, 'I'll get your things—I know where they hang; don't you trouble.' Then, while he limped out into the hall to get her cloak and hat, and his own coat and wide-awake, he said to himself: 'She is a high-spirited girl, and I must go gently and gradually with her.'

Presently they were driving smartly away towards the gate, Drew looking after them, and wondering what had come to his old taciturn partner. At the gate they drew up, and Drumly asked the lodge-keeper which way the 'gentleman' had gone who had passed out about half an hour before. He was shown the way, and then he drove on.

'He must have set out on the tramp to London,' said Drumly. 'We can't possibly miss him along this road, unless he should have reached the common before we overtake him.'

'Oh, drive on, then, please, as fast as you can!' said Dolly.

Then, as they sped lightly over the smooth road, Drumly began to let such things as these fall on her ear—sayings by which she could be neither alarmed nor offended, because they were uttered in a kind of soliloquy: 'It is possible to be too proud as well as to be too humble; and there is a humility that looks like pride as well as a pride that apes humility. The best thing in the few affairs of real moment in life is to be rid of affectations, if possible, and to let nature speak; for, certainly, more coldness, more unhappiness, and more heart-burning are caused by mere misunderstandings, than by anything else in the world. Rank and wealth are not to be despised

in the curious compromise of a world in which we live; but, if you want to know full, enduring happiness, you must set your heart on the simple eternal things of life—love and sympathy, health and honour.'

Thus they drove on, and thus these sayings and simple sentiments fell gently on Dolly's soul, gently as the dew, concerning which, when once it has settled, it is difficult to say whether it has fallen or risen.

Meanwhile, Ferrers was striding on towards the great maelstrom of the despairing and the disappointed—the huge London whose canopy of smoke he could discern miles away as he mounted the Downs. His heart was filled with wrath and bitterness, but, at least, his conscience was now clear. He had made what amends he could for the evil he had wrought. He saw nothing hopeful before him, but he knew he must keep a firm nether lip, and work at something for a living—what, he knew not yet. But he had health and strength: the springy turf of the common on which he had entered was as grateful to the foot as ever, and the evening breeze which blew over the fir-trees and the bracken was fresh to the cheek and sweet to the smell.

He was somewhat discomposed in these thoughts by the sound of wheels behind him. As the sound came nearer it jarred him more. So he turned farther aside from the road, leaving the even turf and plunging in among the bracken. Would it not be pleasant, he thought, to make his bed there for the night, and go on refreshed in the early dawn?—when his ear told him that the vehicle had stopped. He turned and saw that a man and a woman had got out. He was astounded to hear his name called: 'Ferrers!'

Then he saw the man move towards him, and the man limped! Could it be Drumly? What did he want with him? To arrest him? He walked to meet the man.

'What do you want with me?' he asked gruffly when they met. 'Are you going to carry me back, to take me to prison? Well, I don't care!'

'You're a foolish young man,' said Drumly. 'I want to be your friend. And here's a young lady come to have a word with you.'

'What? Miss Dawlish?'

He went to her, hardening his heart as much as possible with thought of all the angry and cruel things she had said to him. He stood in her presence with his hands crossed before him, like a soldier standing at ease. He did not speak.

'I have come after you,' she said, frankly looking in his eyes, 'to speak to you. I have been very wicked to you. I said ugly, cruel things to you, and thought mean thoughts of you. I am bitterly—bitterly sorry! Please, forgive me!'

She let her head droop, and offered her hand. Ferrers seized it in a passion of gratitude, and sank on his knees kissing it, while great, painful sobs heaved his chest, and scalding hot tears were wrung from his eyes. The burning tears fell on Dolly's hand.

'Oh, my love! my poor love!' she cried wildly, now weeping herself. She bent over him, and stroked his head with fluttering hand, scarce knowing what she did, and still cried, scarce knowing what she said, 'My dear! my dear!'

Ferrers rose, still holding her hand. They looked into each other's eyes, and said no word more; but Ferrers took her other hand also, and drew her to him, and with a sigh she leaned her head upon his breast. Then she appeared to come to herself. She drew back covered with burning blushes, which she tried to hide with her hands.

'Come, my dear,' said Drumly, gently taking her arm, 'there is nothing to be ashamed of: you have let nature speak. I think we had better take Mr Ferrers back with us as far as that little inn we passed and leave him there for the night.'

So all three got into the chaise, and in a happy suffusion of silence drove back to the little inn, which stood about a stone's-throw from the margin of the common.

'Now,' said Drumly, when they had been shown into a little sitting-room, 'I guessed it before, and I don't need to be told now, that you two people are fond of each other. For myself, I approve, and I'll stand your friend throughout; but I'm not everybody; there's my partner and fellow-trustee, Drew, to be considered. I'll tackle him for you, and I hope I'll make it all right. But just tell me, Ferrers, will you? one or two facts about yourself. I know a good deal already, but I want to know more—facts about your life and parentage that will suit Drew. Let me see. You've been a soldier, haven't you?'

'Twelve years in the Blues,' said Ferrers; 'and when I left I was sergeant.'

'And I'm sure,' said Dolly with a simple touch of pride, 'a sergeant can be as strong and brave as a general.'

'And what were your people, may I ask?' said Drumly. 'Farming, I think?'

'Yes,' said Ferrers, with a touch of pride on his own part. 'My people have been yeomen in Cumberland for ages.'

'Humph!' said Drumly. 'That ought to be good enough for Drew. And Lord Debrett is an old friend of yours, isn't he?'

'He is.'

'That's a touch,' said Drumly, 'that'll tell with Drew; he has a weakness for that kind of thing.—Well, now, Dolly, my dear, we must go, and we'll come here and see Mr Ferrers to-morrow morning, when I hope to have news for him.'

He considerably went out first, to let the lovers say their adieus alone. They took each the hands of the other, and looked again into each other's eyes, as if anew to wonder at the unfamiliar depth of love and understanding they revealed.

'Was I very—very angry with you?' she asked, hanging her head.

'You were,' said he, 'and I was very miserable; but that is past.'

'I think,' said she, 'I was angrier because you were so humble. Why were you so humble?'

'How could I,' said he, 'be anything but humble before you?'

'Come, Dolly, my dear,' sounded the voice of Drumly; and with a clinging grasp of the hand—no more—the lovers parted.

When they were gone, the little inn could not contain George Ferrers. From hell he had been raised to heaven—from the lowest depth of darkness and despair to the giddiest height of light,

and life, and hope. He went out and walked on the common. As it grew dark, he returned and ate an enormous supper of bread and cheese and ale—it was the first food he had tasted since morning—and that done, he went out again into the open air. He wandered back the way he had come, climbed the park wall, and approached the house, nearer and nearer, till he was against the fence that separated the park from the garden proper. Long he stayed there, waiting—waiting for a light to appear in the window that he knew as hers. There was a light in the library; who, he wondered, was sitting there? Aunt Dawlish with her book and her candle? Or Drew and Drumly discussing his prospects? At length the long-looked for light appeared, and he saw the shadow of a woman's figure on the blind, the blind was raised, the window was opened, and some one leaned out.

'My light! my life! my love!' he murmured, and turned away to get back betimes to his inn.

OUR HERMITAGES.

AMONG the early archives of the city of London is a lease of a Hermitage bearing the date of the eighth year of the reign of Edward II. It describes the hermitage as near the King's Garden, on London Wall; and sets forth that it was granted by the mayor and two aldermen to Sir Gilbert de Hardynham for the whole of his life, on condition that he rendered to the commonalty half a mark four times a year, and maintained the rooms in the hermitage against wind and rain, and otherwise in proper repair; and records that the same Gilbert granted that it should be lawful for the chamberlain to eject him if he failed to comply with these conditions.

There is another document extant, also belonging to the citizens of London, in which reference is made to another hermitage in the same city. This is a presentation to a chantry in the hermitage of Crippllegate, in the first year of the reign of Henry IV., by virtue of which John de Rither was admitted to the chantry founded in memory of Sir Aymer de Valence, Earl of Pembroke, by his wife, in the hermitage near to 'Cripulgate.'

It is curious to find how completely all traces of these hermitages have been effaced. There is not a court, or lane, or inn that bears their names or makes the least reference to them. They have disappeared, and, literally, their places know them no more. But the records we have mentioned are full of medieval pictures for us. The statement that the King's Garden was on London Wall, for instance, brings to mind vividly the old times when the metropolis consisted only of the centre we now call 'the City'; when there were archers practising at the quiet butts now represented by opulent streets and constant traffic; when linen was laid out on the grass to dry in fields now closely packed and hemmed in with houses that are as closely packed with residents; when there were thickets and bushes between Temple Bar and Westminster; when there was a moat, or fosse, round the Tower, and there were edicts forbidding any one to bathe in it; when there were people called 'peters' standing in Chepe selling fish; and pent-houses, haute-pieces, and countless signs projecting on to the

narrow streets; when the gates of the city were closed at curfew, and all the boats on the river moored at night on the city side; and when six 'competent men' turned out nightly in each ward to guard the silent city.

The mention of the hermitage in Cripplegate brings to mind the knights that were so much to Froissart and his times. Sir Aymer de Valence was slain in a tournament on the day of his marriage in the year 1323; and at the date of the presentation, 1399, his widow was mentioned as the most venerable lady Mary de St Pol, Countess of Pembroke. The presentation belonged to the abbot of the monastery of the Blessed Mary of Gerondone, in the diocese of Lincoln, who, in the document in question, sends greeting with honour to the venerable man the mayor of the city of London. The mayor in that year was Thomas Knolles. We may picture the little group with John de Rither in the centre, travel-stained and sunburnt, for he has journeyed from Lincolnshire, perhaps on a palfrey, attended by a man with a sumpter mule, or two, carrying his limited belongings; the mayor, well fed and well to do, with easy complaisance attending to the business before him on the one hand; and a knot of aldermen familiar with the place and the people on the other; set round with a cluster of idlers. The aldermen have been hearing complaints, perhaps, of the noisomeness of the chandlers' selds in Chepe, and ordering notices to be served upon the chandlers to remove their merchandise elsewhere; or of the malpractices of certain tanners who had been selling hides in secret instead of at the seld; or of the tailors who persisted in scouring their furs in Chepe; and they turned to the credentials of John de Rither as a welcome relief to the routine of more ordinary details. It is as though we were permitted to glance back once more, momentarily, through a long-closed gate, upon the city of Richard Whittington, Robert Walworth, Wat Tyler, of Geoffrey Chaucer, and of the Plantagenets.

Though these have disappeared, we have several hermitages in various parts of the kingdom still, more or less intact. One of the most interesting is hewn out of a sandstone cliff that rises to an altitude of about twenty feet on the southern bank of the Coquet, about half a mile from Warkworth Castle. A survey of the possessions of the Percies, made in the reign of Elizabeth, states the hermitage was then 'ruinated' and greatly in decay. The surveyor wrote: 'There hath been in the said parke one house hewn and wrought in a cragg or rock of stone, called the Hermitage, having in the same a hall, kytchen, chamber, and chappell, with a little orchard and garden adjoining the same; in which house hath been kept in times past an hermitry or priest to do and celebrate divine service.' It is still to some extent ruined, on account of the absence of a roof to the hall and kitchen; but the chapel with the chamber beyond it, hewn bay by bay out of the rock, cannot have been otherwise than it is to-day when the constructor of it ceased from his labours and looked upon his task newly completed. This chapel consists of three bays of vaulting which spring from semi-octagonal columns. It is about twenty feet long and seven feet high. It is approached from the pleasant pathway along the river-side by a flight of stone steps overhung with

trees. It is entered by a porch only wide enough to admit one person at a time, which porch has a seat on either side only sufficient for one person. On the inner side of the entrance door may be yet traced a Latin inscription to the effect that the hermit's tears had been his meat day and night. This inscription will be soon quite illegible owing to the disintegration of the coarse grit of the sandstone. Facing the entrance on the opposite side of the chapel is another doorway, giving access to a slip of a chamber beyond it, which runs like an aisle along its full length. The wall of rock dividing the chamber from the chapel is pierced with a large aperture known as a hagio-scope, and an ornamentally cusped and traceried window. In this inner chamber is a recess in the rock that may have been used for a bed, berth fashion; and from it the altar in the chapel can be seen through the hagio-scope just mentioned. The altar has two steps in front of it, and like every other detail, such as ambry, piscina, and a device showing the implements of crucifixion, is hewn out of the rock, as is also a tomb with a recumbent effigy upon it (the Lady Isabel of Dr Percy's poem) that is close by the side of it. There is a small quatrefoil between the entrance door and the recess for the tomb; and additional light is obtained by two narrow lancets, also pierced through the same wall. As has been said, the chapel is perfect; damp and shady, but pathetically intrinsic and enchaining. The hall and kitchen mentioned in the sixteenth-century survey are on a lower site adjoining it, scarcely rising, indeed, much above the level of the footway by the river, and are wrought of tooled masonry. These are now roofless; but there are interesting details to be noticed, among which is a noble fireplace.

There are traditions of immense hauls of fish out of the convenient river, which we may assume found their way into this kitchen. On the top of the rock, above the chapel, are traces of the hermit's garden, the contents of which, doubtless, also tested the culinary capabilities of the kitchen. A flight of narrow worn-away steps winds up the face of the rock, and gives a slight foothold, by which nimble people may climb up to it. When the last hermit gathered his herbs and fruits in it for the last time, is not known. There is, however, a document extant, about half a century earlier than the survey quoted, which mentions its occupation at that time by Sir George Lancastre, to whom the Earl of Northumberland, in return for prayers and daily recommendations, made a yearly grant of twenty marks, with permission to occupy the hermitage with its garden, orchard, and garth, and gave pasture for a bull, twelve cows, and their calves, leave for two horses to range his park, privilege to take a draught of fish every Sunday, and a gift of twenty loads of firewood. Goldsmith's 'gentle hermit of the vale' might have been pardoned should he have envied Sir George Lancastre.

There is another chapel hewn out of a rock at Knaresborough. It is also divided into three bays; but differs from the Warkworth example at the east end, where it terminates in an apse. Another hermitage, at Cratcliff, in Derbyshire, is hewn out of the rock in a similar manner. The chapel of this one is about thirteen feet long, eleven feet wide, and nine feet high; and the

altar and other details are formed out of the solid rock in the same way. At Nottingham there is a set of excavations in rocks bordering the river Lynn, supposed to be the remains of cells occupied by a fraternity of hermits, with a chapel with Norman workmanship on the caps of the pillars in it. There is also a hermitage hewn out of a rock on the banks of the Eden, near Kirkoswald, which is now known as Lacy's Caves; and there is another on the Eamont, near Penrith, now called the Giant's Cave. And there is record of a hermitage at Norham, the site of which is as completely forgotten as that on London Wall.

Among hermits, Godrick of Finchale stands out in bold relief as living up to the theory of eremitical life with much vigour and rigour for sixty-three years. The chamber in which he lived for this long period was excavated out of the ground and covered with turf, and his chapel was annexed to it. He cultivated a small piece of ground, like the rest, and would accept no presents, but lived exclusively on the herbs and roots it furnished, eked out with barley-flour. At night he took for a pillow the stone that served for a table by day; and he practised the further austerity of wearing an iron jerkin. Tradition hands down a declaration that he wore out three of these uncomfortable articles of attire. Fiacre has also left an odour of sanctity that has come down to us. His retreat was in a wood, and his chapel was close by. Here he was visited by so many people, who hoped he could heal them of diseases, and otherwise advise them for their benefit, that he had to make his dwelling larger, and grow all manner of herbs good for pottage in a great garden, that he might feed the poor who came to him.

Word has come down to us, however, of instances in which hermits enjoyed no such goodwill. There is a case on record of one Sir Edwin—hermits were all addressed with the prefix Sir—who had to make a ditch, with a turning bridge over it, by way of fortification round his hermitage; and as the neighbouring shepherds still threatened to burn down his dwelling, he thought it necessary to dig a second ditch outside the first one, to secure himself from them. Among the State papers explored by Mr Froude for his *History*, he notices a memorandum setting forth that while the harbours, piers, and fortifications were being perfected at Dover, an old hermit tottered to and fro every night between his cell and a chapel on the cliff, where, after lighting tapers on the altar, he knelt in prayer. This light from the chapel was seen for some distance at sea, and the anchorite was warned by the workmen that his tapers made a signal for the king's enemies, and that they must burn no more. He continued to perform the same ceremony, notwithstanding their remonstrances; whereupon three of them waylaid him, threw him down, and beat him cruelly.

Sometimes hermitages were at the ends of bridges, as on the bridge over the Tyne at Newcastle; also in the gate-houses of towns, as well as in more secluded places like churchyards. There are frequent instances, too, of anchorages in old churches, and parishes over porches have been occupied by hermits. Perhaps, the very last hermitage of which there is any evidence was a modified one erected rather than excavated

by Francis Brown, in the village of Intakes, in Derbyshire, at the beginning of the last century. He built a chapel for the use of the residents in the neighbourhood, in which divine service was performed once a month, and left it to the parish of Mugginton for ever, after the death of his widow, and his daughter and her husband. On a house adjoining the chapel he placed this statement: 'Francis Brown in his old age, Did build him here a hermitage.' He died in 1731.

And now this curious phase of life has ceased to exist with us; and hermits and hermitages are 'as a tale that is told.' Mrs Piozzi records that the hermit in the hermitage on Mount Vesuvius recognised her, and assured her he had dressed her hair when he was a hairdresser in London. This was in 1784. Evidently the old order had changed before then.

DEAREST IS DEAREST.

CHAPTER III.—CONCLUSION.

It was a hot day in July—a year and nine months after the events recorded in the foregoing chapter. Ballinalack had not changed for the better. If anything, there were more broken windows, more ragged children, more public-houses. The last, it is true, were not so full as we have already seen them, but then most of the able-bodied men and women in the village were haymaking in the water-meadows. The ring of the scythe-blade as the ragstone was drawn along it sounded on every side, and the faint delicate scent of the fresh-cut hay perfumed the air. If the village of Ballinalack could have been wholly wiped away from the face of the earth, the day and the prospect would have been perfection. As it was, there was something depressing about the contrast.

Charles Dardas was riding through the street on his thoroughbred mare. He looked many years older than when we last saw him, and his forehead was furrowed by lines that had not been there then. It was scarcely to be wondered at, for of late he had had much anxiety, and many wakeful nights. Only three months remained of the two years allowed him by his uncle's will for finding a well-dowered bride, and he was obliged to confess to himself that he would find it difficult to fulfil the condition.

As for Mary Davidson, he had forgotten her, or rather persuaded himself that he had. At first, he had attempted, by writing long and specious letters, to shake her determination; but to them he got no answer. Then he made a journey to Dublin, and called at the house where she was acting in the capacity of a nursery governess. The servant told him she was not at home. Having made two more calls with a like result, he reluctantly came to the conclusion that she did not choose to see him, and accordingly went home, to busy himself with the care of his fortune and estate.

In the temper in which he then was, he was not at all likely to prove an over-indulgent land-

lord, and so the people soon found. He quickly became more unpopular in the neighbourhood than even his uncle had been; for the old man, though hard as the nether millstone, yet took a keen interest in his neighbours' affairs, which often flattered their pride. And his nephew took none at all. In fact, with few exceptions, he did not actually know his own tenants by sight. He insisted on their rents being paid on the day they were due, and that being done, he was satisfied. Ballinalack was not likely to alter for the better under him. As he had set his heart upon money, money came to him. He prospered greatly. His stocks and shares rose in the market; there were good farming seasons; and his bargains in horse-flesh turned out prizes. The one thing needed now was a wife, with a dowry sufficient to secure him in the possession of the property for ever.

Lawyer D—— had done his best for him, and had even gone so far as to give him, in strict confidence, a list containing the names of all the marriageable young ladies of whose fortunes he had personal knowledge. It was not a long list, and the young man determined to pay a series of visits at the houses indicated and choose for himself. He found it easy enough to procure invitations, for the people of Westmeath knew all about the will, and had little difficulty in surmising the object of the handsome Squire's 'duty calls.' As for the young ladies, they, as in honour bound, affected perfect ignorance even to their own parents, wondered 'why that stupid Mr Dardas calls so often,' and in their own hearts were wild with jealousy of the other competitors for the prize. Charles Dardas was not a fool; and after a year of visiting, he knew pretty certainly that there were six girls of reasonable age, each possessed of a fortune over five thousand pounds, and any of whom would be only too happy to marry him! And still he did not propose.

The fact was that, like most human beings, he expected too much. As he could not have his own Mary Davidson and his uncle's money, he wished to have a wife as like her as possible. As Mary Davidsons are scarce in this world, it was not at all likely that he would find one. He had not the slightest affection for any of his half-dozen heiresses—the only question was which would be the most bearable with whom to pass the rest of his existence!

At last, one morning, after a restless night, he decided desperately in favour of her whom he considered the least objectionable. She was the daughter of a gentleman-farmer living not far from Mullingar—Ellen Cooney by name. Little was known of her father, beyond the fact that he had made his money somewhere in business, and had bought very cheaply the estate on which he now resided. But Lawyer D—— was well acquainted with the money matters of the family, and guaranteed the five thousand pounds at least. Ellen was a plump, good-natured girl, not given to extravagant habits, and above all, not 'fast.' It would be hard if a man could not get on with her as the mistress of his house.

Nevertheless, the young man was far from happy as he rode out that July day to make his formal proposal. Do what he would to crush

the nobler instincts of his soul, it was very hard to conceal from himself that he was acting a most unworthy part. Not caring to meet any one whom he knew, he put spurs to his steed, and galloped through the village of Ballinalack at a pace which caused the few people who were about to gaze after him, and wonder at the recklessness with which he risked the limbs of his valuable mare on the hard road. When once fairly beyond the houses, he allowed the spirited animal to drop into a gentle trot.

As he reached the turning to the vicarage, he saw the Rector driving towards him in his car. There was a lady with him, whom Charles Dardas thought, from the casual glance he took, resembled Mary Davidson. Of course that was impossible; but he was far from willing to meet the Rector, who had paid him more than one call since his uncle's death, and had put before him some most inconvenient home-truths. The young man again spurred his mare and galloped on past the turning. In his haste, he did not notice that a stone had dropped from the arch of a culvert over a little stream which passed under the road. There was no excuse for his carelessness, for the stone had been out for a month or more, threatening all passers-by by the dangerous hole left in the roadway. The farmer who had contracted for the keeping in repair of that piece of the highway, had, as usual, cared far more for saving his hay than for the lives and limbs of Her Majesty's subjects, and had postponed the repairs till the first wet day. It was an unfortunate postponement for Charles Dardas, for his steed in her wild gallop put her off fore-foot in the yawning chasm. Crash! down she came, breaking her leg in the fall, and her unfortunate rider was pitched over her head and on to his own. Where he fell, he lay, motionless and senseless, on the hard road.

The Rector, and the lady with him, saw the catastrophe. He uttered a sharp cry, and whipped up his horse. She said nothing; but her face grew very white, and she clasped her hands together till the nails dug into the white flesh. In a few moments they had reached the scene of the catastrophe, and both sprang down and went to the side of the man. He still breathed, slowly and regularly; but there were no other signs of life. The lady seated herself on the road and took his head in her lap.

'Drive to Ballinalack, quick!' she said to the Rector, 'and get a door, a mattress, anything to carry him home on. I will take care of him till you come back.'

He obeyed without a word, and she remained alone with the inanimate form in her arms. She looked up and down the road. There was no one in sight, and the Rector's car was far on its way to the village. Then she broke down utterly into a fit of passionate weeping. She kissed the pale face again and again, on forehead, cheeks, and eyes. She called to him by name, and adjured him to look up; but the set face, like a stone mask, remained cold and irresponsible to her caresses. Then she joined her hands and prayed.

It was not very long, though it seemed hours to her, before the Rector's car returned at a brisk trot with four men and an improvised stretcher. They carried the body of Charles Dardas to his

comfortless house and laid it on his bed. The doctor, hastily sent for, made an examination, and declared that there was a severe fracture of the skull, and that, in his opinion, there was no hope whatever of the patient's recovery.

'He may linger on like this for days, or weeks,' said he to the Rector, 'if he is carefully attended to and fed regularly—that is, supposing that you find he can eat! But Nature can't cure a fracture of the skull—nothing can except trepanning in such a case as this, and that would be almost certain death, the bone is so cracked. I would leave him to die in peace!'

'He shall *not* die!' said the lady. 'Help me, Mr Clarke! You do not believe that God will let him die like this without a chance of repentance. I am quite, quite sure He will not! I will stay and nurse him; and if the doctor consents, I will have the best surgeons in Dublin to see him.'

'I shall be only too glad, miss!' answered the doctor. 'But I should advise you to leave him alone for a while, and see if he, by any miracle, recovers consciousness without an operation. Trepanning, I am convinced, would only mean certain death. It cannot be put off too long unless there are signs of inflammation setting in, or unless he is visibly sinking.'

'Do you think that you ought to stay here as his nurse, after all that has passed, Miss Davidson?' asked the Rector, drawing her aside.

'Why not? He is not sensible; he will not know me!' she answered, with a sob in her voice. 'I will leave the moment he recovers consciousness; I promise you that.'

'I can say no more!' said the Rector feelingly.

After that came a long, long time of weary and monotonous watching. The injured man took food without much difficulty; but his condition remained absolutely unchanged. But for the regular, slow breathing, he might have been taken for a corpse. As it was, he was more like a helpless automaton, wound up to perform one unvarying function, and capable of nought beside. Mary Davidson watched by his side night and day. The doctor came now and then, saw no change, and went away. And so the months drew on, and the oats began to turn yellow in the fields, and the nine days' wonder that had caused so much interest and gossip in the neighbourhood was half forgotten.

'I have had a letter from Lawyer D——, Miss Davidson,' said the doctor, coming in one morning. 'I understand from him that unless my patient there is married by the 14th November, he loses a fine property. Do you not think it is time that we tried to get a surgeon who would undertake the trepanning operation? There is just one chance in twenty that it may cure him, and I have long given up hopes of any miracle of nature.'

'If it do not cure him, it will kill him?' said Mary, musingly.

'Yes.'

It flashed upon her how entirely impossible it would be for her to decide on such a question. Had she had her will, she would have been content to nurse him—unconscious as he was—for years, rather than run the risk.

'You must decide, doctor,' she said.

'Then I will write to Dr K—— to-day. He is the best surgeon in Dublin.'

'I will stay by him till the last minute, anyhow,' thought poor Mary rebelliously. She dared not think of what the probable end of her watching was to be!

Two days after, Dr K—— arrived. He was a short, fat, fussy little man, with strong hands and a clever head. He held a long consultation with the village practitioner, and then declared that he would risk the operation, as there was absolutely no chance for the patient otherwise.

'I must have two capable men to assist me, who won't faint at the sight of blood,' he said, in his sharp way. 'You'll do for one, doctor; but who else can we get?'

The doctor's eyes fell upon the Rector, who had come to take Mary away.

'I will assist gladly,' said he simply. 'But I came here to drive Miss Davidson to the station. Is there any one who can do so if I stay here?'

'Who is Miss Davidson?' asked Dr K—— sharply. 'Not the lady who, I am told, has been nursing the patient.'

'Yes,' the Rector answered. 'There are important reasons why she cannot possibly continue her functions here.'

'Important fiddlesticks!' said Dr K——. 'What is more important than a man's life? Some girlish nonsense and prudery, I suppose! I tell you, sir, if I have not a good nurse on the spot, I won't operate at all. She seems to have a turn that way, and she shall stay. You may just unharness your trap.'

The Rector was in a difficulty. Miss Davidson had originally called on him to learn what news he could tell her of Charles Dardas. He had promised her not to betray her visit to the young man, and now he was on the horns of a dilemma.

'I must ask her!' he said nervously.

'I'll ask her!' said the surgeon, and threw open the door of the sick-room. 'Miss Davidson!' he said, 'I am master here at present, being in charge of the case. I must have a good nurse, and they don't grow such commodities in Ballinalack. You must just make up your mind to stay.'

Mary looked at the Rector. His eyes were cast down, and carefully avoided meeting hers. A slight flush rose on her cheek, and then subsided again, leaving it very pale. 'Very well, sir, I will stay!' she said.

An hour later, all was over—successfully. Mary had sat on the stairs while the men were busy in the sick-room—a mass of quivering nerves, her ears straining to catch the slightest sound. She heard nothing but murmured words, and occasionally the voice of the surgeon speaking sharply. And then at last there was a pause and a great stillness; and after that, came down the stairs to her, as to the prophet Elijah, the sound of a still, small voice. 'Mary!' it said.

Then she rushed up the steps and into the room. Charles Dardas was lying on his bed as she had left him—pale and wan—but his eyes were open, and in them again the glorious light of reason. 'Thank God! Oh, thank God!' she cried, and fainted, falling on the floor.

'This is your nurse!' said the surgeon with great disgust, looking at the doctor.

The Rector stayed with Charles till the evening. Perfect quiet had been enjoined, and he absolutely refused to reply to any questions the sick man put to him. At last Mr Dardas gave it up as hopeless, and ceased to worry his brain about time or place. The window was open, and the warm south-west wind stole in and touched his hot forehead like a kiss of peace. By-and-by he dropped into a peaceful and dreamless slumber. When he woke it was dark, and there was a night light burning on the table. By his side sat Mary Davidson, her busy fingers employed in knitting, while her eyes followed the pages of a book on her knees. He watched her for a moment unobserved, and then she looked up, and her eyes met his.

'Mary!' he said.

'Do you want anything?' she asked, standing up, and turning her face from the light to hide the tell-tale blush that mounted in it.

'I want *you*!' he answered. 'Oh Mary! can you ever forgive me? What a fool I have been! Don't go away and leave me, or I shall die!'

'I will not go till morning; I promise you that!' she said. 'But you must not talk now; the doctor forbade it. Lie still, and try if you can sleep again.'

'I think I can, if I hold your hand!' he said, with a faint smile. 'Then I shall know that you are here, and have not left me.'

She gave him her soft warm hand, and sat quiet, her face still turned away. He watched her for a while, and then his weary eyes closed again, and he slept.

Great was the surprise of the neighbours when the banns were published of Charles Dardas and Mary Davidson. No one knew who the bride elect was; and the Rector, whose kind heart was brimming over with joy, kept his own counsel. To the great disappointment of the people, the time of the wedding was kept a secret, and the ceremony was only witnessed by a few lucky individuals who happened to be in the vicinity of Inny Church when the cars drove up. But the news spread like wildfire; and when the bride and bridegroom left the building, there was quite a concourse of villagers assembled, and whole showers of blessings were heaped on Mary as she passed through them. With the true Irish instinct, they recognised the fact that a change had occurred, and that it promised better things for them all.

Charles Dardas paused at the church door and whispered to his wife. 'Mary,' he said, 'I have not done my duty to these poor people; I have been hard on them, and now I have lost the opportunity of ever repairing the wrong. Do you not think I had better tell them I am sorry, and that if I were their landlord again I would act differently? It is but poor reparation; but I feel I must do it.'

'I don't think you need, Charles!' said Mary smiling, 'because—because—is not this the 12th of November?'

'Yes; but'—

'Oh Charles! you never heard that my aunt left me seven thousand pounds when she died, three years ago. Of course, I could not tell you.

I waited to see if you wanted me or your uncle's money; and now you will have both! You are not angry with me?'

'Angry!' He took off his hat, and looked solemnly upwards. 'May God register my vow, that since He has given me another chance to repair my wrongdoing in the past, I will from henceforth look upon money only as a trust from Him to be used for His service. He has been far more merciful to me than I have deserved.'

'That is true, Mr Dardas,' said the Rector. 'But which of us cannot say the same?'

WHERE SPONGES COME FROM.

SPONGES are found in all parts of the world. Three hundred different species are known to naturalists, some of which are found even on our own coasts. The number of these which have a commercial value is, however, limited. The sponges of Syria and the Archipelago are the best, and are used for the toilet and for delicate operations in art and industry. The species found in the Bahama Islands are of very inferior quality; but their moderate price has led to their extensive use. The Tunis sponge, which is extremely durable, is also very useful, as it is adapted for very rough purposes. These practically comprise the useful sponges, though available species are also found on the coasts of Africa.

The Tunis sponge is black in its natural state, and covered with a viscous fluid, which constitutes its polypus, and it also contains a considerable quantity of sand and mud. The depth of the water from the bottom of which it has originated and developed has much influence on its quality; and that which is found upon a rocky or sandy bottom is much better than that which is deposited on slime. The sponge fisheries are principally near Kerkenah, and on the rocks of the small island of Kamontes and in the Gulf of Kabes. The sponges found in the last locality are poor, owing to their roots penetrating deep into the mud with which the gulf is lined. The most active and profitable fishing season is in the months of December, January, and February. The storms of November and early December free the sponges from lichen and seaweed, and thus render them easily discernible by the eye. The fishing is pursued throughout the whole year; but in the summer, which lasts from March to November, it is less productive than in the other portion of the year, owing to the thick marine vegetation which then conceals the sponges from view. In the summer, fishing is necessarily confined to rocky bottoms, and is carried on by means of diving apparatus. The winter is therefore, as already stated, the most favourable time, though it has also drawbacks. It is more stormy than summer; and as calm weather and a transparent sea are indispensable, more than half the time is usually lost through bad weather. The fishermen are mainly Greeks and Sicilians, the former being considered the more expert.

There are several methods of obtaining sponges. They are gathered by hand under the protection of a diving-bell, harpooned by means of a trident,

or dredged by a machine similar to the drag-net used for catching oysters. As the diving-bell can only be used on a solid bottom, the harpoon is the method most commonly employed. The Arabs work in small boats, manned by crews of five or six men, one of whom is armed with a trident. While the others propel the boat, the harpooner leans over the bows and carefully examines the bottom of the sea. If he can discover any sponges, the boat is manœuvred so as to bring it into the most suitable position, and the trident is thrown to a depth rarely exceeding nine to eleven yards. The method of the Sicilians is very similar to that of the Arabs, the difference being that their boats carry only two men, the harpooner and the rower. The dexterity which these two employ is very remarkable, particularly when compared with the performances of the Arabs. They also work in deeper water than the latter, and thus secure a yield more plentiful and of better quality. The Greek fishers chiefly use the drag-net, though a very large number work with the harpoon. Calymnos, an island on the coast of Asia Minor, contains about twelve thousand inhabitants, and nearly all the able-bodied men amongst this population are engaged in sponge-fishing. For active service in their boats they form crews, known under the name of *tchourmo*. Each of these crews consists, according to the old system, of a chief-boatman, three to six fishers, and two or three assistants, called *copadés*. The more modern plan, however, is for the crew to consist of a head-boatman, a master-mechanician, and a staff of twelve men to manage the machine employed. Each crew works on its own account, but several often unite to form a group under the direction of one chief, called *malsaabi*. This person is a capitalist, who advances money for all the expenses of his crews, such as food, clothing, &c. He keeps a detailed account of all the money he advances, and at the time the crews leave in April or May, renders a general statement to the captain of each boat. The captain then gives him an acknowledgment in writing for the sums advanced, and in his turn receives from his crew acknowledgments for each man's share of the debt. The total amount does not generally exceed two hundred and thirty pounds for the ordinary boats, and seven hundred and fifty pounds for those provided with mechanical appliances. The legal authorities decide all disputes arising out of these transactions. The Greek fishing expeditions start in May, and return at the latest at the end of September, and are employed in the Greek Archipelago as well as in Tunisian waters. They have better boats than their rivals, and are, as we have already said, more successful than either the Arab or Sicilian fishermen. Three voyages are made during the season, the sponges being brought back to Calymnos and sold there. The advances made by the *malsaabi* are deducted from the proceeds.

Sponges are generally obtained from a depth varying from fifteen to twenty feet. Below this depth none are found of any commercial value. Sponge-divers must be adult men, of great physical strength, and capable of remaining under water for two minutes. There are two methods in vogue for divers. The first is that in which the diver is drawn to the bottom of

the sea by a weight attached to his body. He there searches for sponges with his hands, distinguishing the good from the bad by touch. Those which he selects are put into a kind of bag, hung round his neck; and when he is ready to re-ascend, he pulls the cord which is fastened to the weight already mentioned. This is a signal to the *copadés* in the boat above, who immediately draw the diver to the surface. Under the second or new system, *scaphandriers*, or divers clothed in diving costume, are employed. This costume consists of india-rubber clothing and a metal helmet, and is very similar to that used by divers in this country. Weights are attached to the feet to keep the diver in a vertical position, and he is supplied with air from a pump carried in the boat. By means of this apparatus a man can remain under water for two or three hours and gather an abundant quantity of sponges. This system has, however, been prohibited in Turkey.

The inhabitants of the islands of Hydra and Cranidi use tridents, and sometimes nets. The system of fishing with nets consists in scraping the bottom of the sea by nets kept by weights in a vertical position, while the boats to which these nets are securely fastened advance with all possible speed.

For trading purposes, the sponges are sorted into three qualities—fine sponges, coarse sponges, and an inferior kind called *tsimouches*. The quantity annually brought into Calymnos is about one hundred and twenty-seven tons of the first, seven hundred and seventy-five tons of the second, and three hundred and forty tons of the third description. The price of the best quality varies from 9s. 6d. to 31s. 6d. per pound; that of the coarse kind from 5s. 6d. to 8s. per pound; that of the inferior sort from 5s. 6d. to 7s. 6d. per pound. In sorting, a fourth kind, inferior to all the others, is put aside, which is called *scarto*. The best quality is principally obtained on the coast of the little island of Stambalia and on one or two points of the African shore; the second in the waters of Rhodes, Crete, and Syria; and the third on the coasts of Turkey and Greece. These sponges are sold in nearly all civilised countries, but especially in Europe, England being the principal consumer. The dealers of Calymnos, Symi, and Rhodes are travelling hawkers, and visit all the chief cities of Europe to dispose of their wares, which they carry on their backs, either in a sack or threaded on string. Calymnos annually exports sponges to the value of one hundred and twenty-five thousand pounds.

A few concluding lines may be given to the attempts made to prepare artificial sponges. M. Oscar Schmidt, a Professor at the university of Grätz, in Styria, has been the most successful hitherto in this direction, and the Austro-Hungarian Government has authorised him to develop their manufacture on the coast of Dalmatia. The Professor's method is a simple one. Choosing a good healthy sponge in the spring, he divides it into a number of pieces, which he plants in a favourable part of the shore. They are fixed to and maintained by props, and develop in three years, according to M. Schmidt, into sponges of good size. His experience leads him to believe that four thousand sponges can

be thus obtained for a cost of nine pounds, all expenses included. As the cheapening of sponges is conducive to cleanliness, we wish the new undertaking every success.

THE CUTTING-OUT OF THE 'CHEVRETTE.'

THE French corvette 'La Chevrette' was anchored in the Bay of Camaret on the 20th of July 1801. Outside the bay, a squadron of English frigates held the united fleets of France and Spain under observation. Although isolated from the allied fleets, the 'Chevrette' was protected by the natural difficulties of swift currents and a rockbound coast; and lying under the guns of several batteries, was considered beyond the reach of the audacious British tars. That night, the boats of the 'Doris' and 'Beaulieu' attempted to enter the bay and cut out the corvette. The darkness of the night foiled the attempt. The boats were dispersed, but lingering in the bay until daybreak, were detected by the enemy. Thus warned, the commander of the 'Chevrette' prepared to give the British sailors a hot reception should they repeat their attempt, although the seizure of the vessel was regarded as impossible. The vessel was taken a mile and a half higher up the bay, and moored under the protection of the batteries. A gunboat, carrying a couple of thirty-two pounders, was moored at the entrance of the bay; redoubts were hastily cast up for the further protection of the corvette, and the gunners in the batteries were on the *qui vive*. On board the 'Chevrette' the boarding-nettings were put out, the foot-ropes of the yards were strapped up, arms and ammunition were disposed upon the decks, and the cannon were loaded with grape-shot. The crew was augmented to nearly four hundred men by reinforcements of troops from the shore.

From the 'Beaulieu,' these defensive measures were observed with great interest, the tars occupying themselves in grinding their cutlasses for the cutting away of the boarding-nettings of the French corvette. Afternoon stole on before the 'Chevrette' had completed her precautions, and she then hauled up a large French ensign above an English one.

The long-expected night at length closed in, and at half-past nine the boats of the 'Beaulieu,' 'Doris,' 'Uranie,' and 'Robust' assembled under the command of Lieutenant Losack, and began to pull slowly towards the 'Chevrette,' lying some six miles off. The movement had scarcely taken place when a strange boat put out from the shore, and Lieutenant Losack, imagining it to be a French lookout boat, started in pursuit, accompanied by several other boats. Time elapsed; a breeze sprang up against the boats, and Lieutenant Maxwell, the senior officer in the absence of Lieutenant Losack, rightly judged that the boats must proceed if anything was to be done that night. He commanded the six boats of the 'Beaulieu,' manned by over eighty volunteers, whom he had enjoined to keep together, for he had determined to attack with them alone, should the other boats

separate in the darkness. He accordingly led with his six boats, and entered the bay at about half-past twelve. A perfect calm had succeeded the late breeze. The French were on the alert, and their signals to and from the shore were clearly perceived. The moon dipped beyond the horizon, and the short July night was far advanced, yet Lieutenant Losack and his boats had not turned up. Some discussion took place, and the officers were undecided whether to push on and attack, or abandon the enterprise for that night.

Lieutenant Maxwell solved all doubts by ordering a general advance. At this moment a gentle breeze sprang up from the south, and, blowing out of the bay, raised the hopes of all. As the boats sped over the waters, impelled by muffled oars, Lieutenant Maxwell instructed the topmen of the 'Beaulieu' as to their proceedings on gaining the decks of the 'Chevrette.' Some were to cut the cables, others to make for the rigging and cut loose and shake out the canvas; the quartermaster was ordered to take the helm; and, to provide for the possibility of the tiller ropes being cut, sailors were appointed for the rudder-chains.

On sighting the 'Chevrette,' they were immediately challenged, and saluted by a continuous fire of musketry and grape-shot from the ship and forts. Steadily the boats held on, those of the 'Beaulieu' leading, seconded by the 'Urania's' boats under Lieutenant Neville. The 'Chevrette's' starboard bow and quarter were attacked by the 'Beaulieu's' boats; while her larboard bow was assailed by the 'Urania's' boats, seconded by one from the 'Doris' and another from the 'Robust.' In the conflict that ensued the French held the boarders at bay, and carried the hand-to-hand conflict into the boats, fighting desperately 'with firearms, sabres, tomahawks, and pikes.' In the *melée* the assailants had to cast away their muskets and close in with boarding-pike and cutlass. Three minutes after the boats closed, the assailants had gained a footing on the already ensanguined decks of the corvette; and while contending with heroic resolution, and suffering severely from the numbers and fury of their enemies, 'down came the three topsails and courses, the ship at the same time casting, the cable being cut outside.' The selected topmen had cut their way up the rigging and to the wheel, and although in several instances suffering from wounds, they stretched along the yards, cut the lashings with their cutlasses, and shook down the canvas. Half the assailants were *hors de combat*, and the conditions of the struggle were in every respect favourable to the French; yet no sooner did they perceive that the 'Chevrette' was under way and moving from the batteries, than they were seized with a fatal apprehension of defeat and captivity. Casting away their weapons, many of them leaped overboard; while others took refuge below, leaving their ensanguined decks in the possession of the hardy Britons. These brave fellows were placed in a very trying position, the batteries plying them with a storm of shells and thirty-two-pound shot, while the French sailors maintained a continuous fire from the holds, and repeatedly exploded large trains of gunpowder, with the intention of blowing up the quarter-deck.

Lieutenant Maxwell divided his men into two parties, one armed with the muskets and ammunition of their enemies, to hold the Frenchmen at bay; and the other to throw overboard the dead, clear the decks, and devote every energy to the sailing of the ship. Unfortunately, they could not use their boats to tow their prize, for some were sunk; others, burdened with dead and wounded men, were adrift, and the sound boats that retained their crews were collecting the drifting boats and towing them out of range of the batteries. Two hours of peril passed; then the ship cleared the batteries in triumph, with every stitch of canvas set, even to the topgallants. The French now lost heart, and being threatened with 'no quarter' if they continued their useless resistance, they submitted to their hard lot and threw down their arms.

The prize was not yet secured; for a force from the allied fleet might interpose between the captors and their squadron; indeed, there was grave apprehension that this was imminent, for a number of boats were perceived approaching from the direction of Brest. Lieutenant Maxwell at once drew up his sailors along the ship's sides to meet the expected assailants, with musket, pike, and cutlass. As they drew near, they were recognised as Lieutenant Losack's boats; and to that officer Lieutenant Maxwell duly surrendered the command of the 'Chevette,' which was carried to the British squadron without further adventures.

During this memorable engagement the British had eighteen men killed, one missing, and fifty-seven wounded. The French lost eighty-five men, their captain, one military and two naval lieutenants, and three midshipmen. In addition, they had sixty-two men wounded.

The boatswain of the 'Beaulieu,' Mr Brown, distinguished himself by his gallantry, and contributed largely to the success of the enterprise. Henry Wallis, quartermaster of the 'Beaulieu,' was severely wounded in fighting his way to the helm of the 'Chevette,' but resolutely maintained his post, and steered the vessel out of the fire of the batteries. Quartermaster Richard Smith was struck and rendered insensible while steering one of the boats; but on regaining consciousness, took a prominent part in the struggle. A topman was wounded in the body and arm, and bled freely, but persisted in going aloft, although advised by an officer to retire until the tourniquet was applied. He remained aloft until the sails were set, but immediately on reaching the deck fainted from loss of blood. In gallantry and endurance this brave man was perhaps equalled by John Ware, who lost his left arm by sabre-stroke while attempting to board. He fell into one of the boats, but bandaged the stump of his arm and returned to the conflict, keeping the deck through all the fierce fighting that followed.

By such men, in such actions, were our naval laurels won. Sailors and marines appear to have been raised above all fear, despite the almost hopeless character of the struggle; and their physical endurance appears to have been equal to their courage. The cutting-out of the 'Chevette' is considered one of the most daring exploits of our sailors; yet it is all but lost from our records, and may be vainly searched

for in works that deal largely with our naval and military history.

Lieutenant Maxwell presents us with a notable example of a naval officer of the old French wars. His courage and conduct are proved by this one chapter in his life's history. Evidently, his confidence in his sailors was equalled by their reliance upon his ability to lead them to a successful consummation of the exploit.

MODERN INNOVATIONS.

WHILST recognising the advantages resulting from modern discoveries and inventions, we cannot refrain from lamenting the decadence of ancient customs endeared to us by early associations. Although history in many instances repeats itself, we can scarcely hope to see the simple habits of the good old times revived; in fact, they would hardly suit the tastes and requirements of the present generation. Yet who does not love to recall the memories of that bygone age, to listen in imagination to the soft crooning of the spinning-wheel accompanying the lilt of the comely cottage lass, hand and foot in busy motion? But the noisome factory has supplanted this home industry; the stormy din of machinery with its hideous discord, the groaning of cranks, and whirling of flying wheels, are the sounds that now greet us. We have no intention of underrating the results of scientific inventions and the development of industrial undertakings, though we may with loving tenacity cling to the old historic past—that past now dim through the mist of years, haunting us like the refrain of some half-forgotten melody. Formerly, the world was in its childhood; now it is grown up, if we may use such a term. It has cut its wisdom teeth; but has wisdom been the result—such wisdom as would atone for loss of the winning simplicity, the generous impulse, the good-fellowship that distinguished our ancestors? They were wise in their generation. Can so much be said for their descendants? Many children of to-day are children no longer, only travesties of their elders, sacrificing the grace and sweetness, the trustful love of innocent childhood for the grim distinction of posing as stunted men and women.

Would any youngsters of the present day dream of piling a golden barricade of May flowers to keep the fairies at bay, and prevent their egress upon May eve? How they would ridicule the grotesque idea. Better for them that credence in the existence of the elfin band still continued—that a veritable fairy queen should revel amongst the woodlands, holding her court beneath the greenwood tree—that the Titania of Shakespeare should frolic amid her sister elves, her moonlit rambles extending beyond the narrow limits of a theatrical stage! The mystical rowan-tree, or mountain-ash, formerly dedicated to the pygmy race, and the haunted thorn, once regarded with feelings of veneration, have now been shorn of their honours.

In remote country districts may still be found ancient dames who, possessing treasures of legendary lore, faithfully recount their experiences of the doings of the wee folk, causing the hearts of the listeners to thrill with a delicious excitement, pleasurable enough in the daytime, but remembered with dread at the mirk midnight hour. How delightful it is to meet with one of these venerable chroniclers who has earned her degree in the school of the imagination. Woe betide the listener who doubts the veracity of the narrator; dubious of the existence of such gentry as fairies, banshees, and goblins, if they incautiously inquire if they really were to be met with in remote ages, the indignant crone would boldly assert that she had seen them, and had, moreover, listened to the mournful wailing of the banshee.

The simple, harmless amusements and recreations formerly held in high esteem would now be tabooed as puerile and childish. Excitement is the order of the day—excitement so powerless to ensure contentment and happiness. Even amongst the humbler classes tastes have become so perverted that avocations formerly undertaken with zeal and avidity have lost all interest; household occupations are carried on under protest. It would be difficult to convince the buxom dairymaid that by a faithful discharge of her legitimate duties she maintains a higher dignity than by strumming on a dilapidated piano, bought at some cheap sale, or skimming over the pages of a penny novelette. Unlike Perdita, she disdains the manufacture of ‘curds and cream.’ Yet, is not pastoral life the very essence of truest poetry, and the sweet song of the milking maiden melody of as high an order as ever rang through concert-room or music-hall?

Amongst some of the peasantry who have not been demoralised by new-fangled notions there exists a passionate love of Nature, a wholesome relish for her bountiful gifts, a keen enjoyment derived from the contemplation of the humblest flower that blossoms by the wayside. It would be indeed a stolid mind that could dwell in the midst of country sights and sounds and remain insensible to their benign influence. What vision more lovely than the breeze-swept swaths of flax ‘when lint is in the bell,’ or the green fields starred with buttercups? Could any distilled essence compete with the fragrant odour of the almond-scented meadow-sweet? or the ear-splitting cadences of the trained artist compare with the witching strains of the skylark?

Clinging to obsolete methods and appliances, we are unfashionable enough to prefer the measured thud of the flail on the barn floor to the creaking of the thrashing-machine; there is something picturesque in the attitude of the fine stalwart men who with vigorous strokes separate the chaff from the wheat. The reaping-machine is a sorry substitute for the sturdy band of men and women who, with sickle in hand, reaped the golden corn and bound it in sheaves. And what shall be said of the novel invention yclept the daisy-clipper? Why should this simple wilding be guillotined to please the fastidious tastes of the present day? the ‘modest, crimson-tipped flower’ of poor Robert Burns be consigned to oblivion, obliterated from parterre and lawn, lest its white starry blossom should mar the

beauty of the emerald sward! Could the Scottish bard revisit earth he would in truth mourn ‘the daisy’s fate.’

The social gatherings that formerly enlivened the sons and daughters of toil exist no longer. The genial ‘quiltings’ where lads and lasses met in the long winter evenings are heard of no more. We question if any of our readers understand the meaning of the word. For their enlightenment we may inform them that the patchwork counterpane once in vogue was stretched upon a frame in the farm-kitchen, where a group of young girls stitched cover and lining together in fanciful patterns, whilst their respective swains were in attendance to thread the needles and pay sundry services required. After the completion of the task, and the gaudy coverlet with its cotton mosaic-work duly extolled, the party adjourned to the barn, where a merry dance was improvised. Alas! the feet that tripped so nimbly through the mazes of the jig and reel are now motionless for ever; the blind fiddler who stamped in time to the jocund sound has vanished from the scene, and the bagpiper’s shrill music is seldom heard. The Spanish waltz and polka are substituted for the homely country-dance, rustic youths and maidens awkwardly burlesquing the airs and graces of their betters.

To return to the subject of recent inventions. Doubtless the incubator is considered a great desideratum for the production of poultry; but somehow the motherless chickens present a very forlorn appearance with no sheltering wing to which they can resort in danger. We miss the cluck of the parent hen; the piping cry of the callow brood hastening to partake of the food that her care has rendered suitable. If ignorance is bliss, perhaps the newly-hatched flock, having never known a mother’s care, do not feel the want of it; nevertheless, to our mind they present the aspect of waifs and orphans.

What new marvels may be awaiting us in the future it would be impossible to conjecture; but it is to be regretted that in the vaunted march of progress so many interesting landmarks of the past should be obliterated, that the healthful feeling of real enjoyment should give place to forced mirth and unwholesome excitement, false as the artificial bloom upon the cheek of faded beauty.

THE MULE-SKINNERS.

WHAT on earth do they use the hides for? How many can a man skin in a day? Such were the questions propounded to us by an Eastern man in America one day, in answer to a remark of ours about mule-skinner. Let us undeceive the reader if, after reading the title to this sketch, he is labouring under the same impression. The men we refer to are not employed in taking the hides from this much-abused long-eared animal: indeed, were they so employed, there would be work for but few, because in the South and West of America, where this animal is generally used, it is a standing joke that a mule never dies, but when he has entirely outlived his usefulness, simply disappears.

Laying all jokes aside, however, the mule is one

of the longest-lived animals we have, and a sick mule is such a rarity, that the saying, 'Tough as a Government mule,' is a by-phrase among Western men. Instead of skinning dead mules with knives, the men to which this term is applied were employed to drive live mules, in wagon-trains loaded with freight across the plains and mountains before the different systems of railroads had invaded our wild West. The mule-skinner proper is not entitled to rank as such until he can handle six or eight of these animals in one team with one line, called a 'jerk-line.' His team is arranged in pairs ahead of each other, and the line is fastened to the bits of the near-side mule of the lead pair, and passes through the bits of each near-side mule to the pair in the lead of the wheelers. The teamster rides the near-side mule of this pair, and with one end of the jerk-line in his hand, guides his entire team by a series of jerks the significance of each of which is thoroughly understood by the leaders.

It is a sight to be remembered to see a train of these wagons, which often numbers twenty or thirty teams, behind each of which will be two or three large freight-wagons coupled together. The capacity of each of these is from eight to twelve thousand pounds. Everything necessary or useful in a town or mining camp used to be hauled in this manner across the prairies, swollen streams, muddy gullies, sand-hills, and mountain roads for distances of several hundreds of miles; the load of each wagon being protected from the elements by heavy duck wagon sheets or covers stretched tightly over a framework of wooden bows, which makes the wagon look much larger than many of the houses by the roadside. Nor were mules the only animals used for this work, for the patient ox was then in great requisition by the freighters, who would use eight or ten yoke of oxen in one team driven by one teamster, designated as a 'bull-whacker.'

The men who were employed in this work lived under canvas almost the entire year through, and a more hardy, healthy lot it was hard to find. Usually they were from a different grade in society than the old-time cowboys, among whom one would often meet educated young men, who followed the life of the cowboy because of the excitement, danger, and adventure continually met with either on the trail, round-up, or even range-camp. Compared with this, the life of the mule-skinner was tame and uneventful—in fact, too monotonous to suit the lover of danger and adventure. Each day followed the previous one, the hours being filled by the performance of the same duties. It was: rise about daybreak, except in the winter months, when the foreman or wagon boss called his teamsters before day had even thought of dawning. While the drivers are eating breakfast, the night-herder, who has had to watch the mules or oxen during the entire night while they grazed on the prairies, brings the herd to the wagons, where, if mules, they are fed on oats or Indian corn in boxes fastened to the sides and ends. Breakfast finished, each driver harnesses or yokes his team; and at the word of command from the wagon boss the train starts out on the road, one team following another in single file. An average of fifteen miles a day loaded is considered a good drive over prairie roads, and twenty with empty wagons.

Such is the life of the mule-skinner day after day, week after week, rain or shine. At both ends of his trip he usually stays over one night, and sometimes longer in the towns to and from which he drives his team; this time was usually spent in carousing, gambling, and kindred sports.

AFTER-THOUGHTS.

AND thou art dead! Thou, too, hast passed away
Into the night that borders on our day;
The noisy world that shall be still at last,
Has left thee silent in the silent past.

How can I grieve? So little thou and I
Saw of each other in the time gone by,
I scarcely miss thee; yet I wish, somehow,
That I had loved thee then, and missed thee now.

I know I never loved thee as I ought;
I fear I wronged thee many times in thought;
If I enough had loved thee to confess
Those thoughts to thee, I might have wronged thee less.

Two oceans roll between us now, the sea
Known and unknown; the last sun set for thee
There in New England; Time, for thee, was done,
And a world ended, and a world begun.

Here—here at home was sure, slow death; but there,
Over the seas, life smiled with promise fair,
And, fleeing from the Shadow that men fear,
Thou didst but meet there what thou fled'st from here.

There, at the last, no heart that loved thee filled
With anguish, no familiar accents thrilled
With thought of home thy spirit's dark eclipse;
No kiss of loving lips was on thy lips.

Strange voices spoke to thee, and eyes as strange
Watched thy wan features change—till the last change
Fixed them in one long look of quiet blest;
And strange hands bore thee to thy lonely rest.

Out through the night, across the pathless deep
My spirit passes to thy place of sleep,
And sad with thought of things that may not be,
Yearns for a voice that might awaken thee.

O vain desire!—I never loved thee, yet
To-night my heart is shadowed with regret;
O vain regret! now earth is closed above thee,
My grief is only that I did not love thee!

THE EARLY HISTORY OF CLUBS.

IN his great Dictionary, Dr Johnson defines the word Club as 'an assembly of good fellows meeting under certain conditions,' and proceeds to illustrate his meaning by a sentence from Dryden: 'What right has any man to meet in factious clubs to vilify the government?' Though such a definition was no doubt sufficient in the day in which it was written, it is to-day utterly inadequate to include the vast series of organisations known as Clubs. Of the people in whose daily life a club plays an important part, it may be safely asserted that not one in a hundred has any idea of the origin and early history of the institutions with which he is so familiar. Clubs seem so essentially modern, so much a part of our everyday lives, that we are apt to forget that they have any history at all. We are proverbially ignorant of common things, and though industrious people have written volumes on such matters, they do not seem to have been very successful in putting an end to the prevailing gloom. The history of clubs is a subject of considerable interest, taking us back to the classic days of Greece and Rome, and thence to the days of Queen Elizabeth, reminding us that, after all, there is nothing new under the sun.

It is to Greece that we must look for the first page of the story. Of course, the old Athenian clubs were not in all respects similar to those of modern London; but there was nevertheless between them a strong affinity, for Aristotle tells us that men of the same trade and members of a particular tribe were wont to club together for business purposes. He goes on to say that others combined for the sake of social intercourse, and adds that 'these meet together for the sake of one another's company and to offer sacrifices; when they meet, they both pay certain honours to the gods, and at the same time take pleasures and relaxation among themselves.'

In Rome, the earliest clubs were the trade guilds founded by Numa, similar to the guilds of craftsmen which play so important a part in the

art history of the middle ages. At one time, there were eighty of these guilds in Rome alone, and they were not confined to the metropolis, for the boatmen of the Seine at Paris and the boatmen of the lower Rhone formed clubs of their own. Very closely allied to the masonic lodges of our day were the secret societies formed throughout the Roman Empire for the practice of religious rites unknown to the State. An idea of the extent of club-life in Rome may be obtained from the fact that even the slaves attached to the great houses of the city formed clubs of their own. In the house of Augustus there would seem to have been several clubs of this kind, for his *chef de cuisine* left a sum of money for the benefit of the club of cooks, of which he was a member.

The history of the purely social clubs of the Roman Empire is incomplete. They were formed chiefly by Romans employed in the more distant parts of the empire, in order to lessen the feeling of isolation which their exile involved. Notwithstanding that military clubs were prohibited by the State, they were tolerated amongst the officers of regiments employed in foreign service, as a compensation for the social disadvantages entailed in a long residence abroad. The rules of a club of officers of a regiment on service in Africa have been discovered on the site of a Roman encampment. They are engraved on two stone pillars, which stood in a conspicuous position near the residence of the commander. The contribution to such a club was about twenty-five pounds, two-thirds of which were returned to his representatives on the death of the member, or to himself on his retirement from the service. The expenses of the funeral of a deceased member were paid by his club, or he might claim a portion of his contribution to enable him to travel in foreign countries. If he made use of this privilege, the liability of the club to bury him was at an end.

Another form of the social club was the ladies' club. Although we are accustomed to look upon ladies' clubs as institutions especially characteristic of our own times, they are in fact far older than English civilisation itself. The ladies' clubs of

Rome were very numerous, and met for religious as well as for social purposes. The most distinguished of them was known popularly as the 'Senate of Matrons.' Its title was derived from an imperial edict. Attached to it was a debating society in which momentous questions of etiquette and dress were discussed with becoming gravity. Sometimes the fair women so far condescended as to interfere in municipal questions, and when a man who was so fortunate as to gain their goodwill died, the ladies erected a statue of their hero.

Political clubs were common to both Greece and Rome. Mr Grote has shown that the Athenian aristocrats on the one hand, and democrats on the other, advanced their principles by means of political clubs in much the same way as is done throughout Great Britain to-day. A select company of the young men of Greece, inspired by the teachings of the voluptuous epicurean Aristippus, formed themselves into a club, to which they gave the gloomy and significant title of 'Those about to die together.' A weird description of the banqueting-hall of these eccentric individuals remains: 'Over some flasks of the red Chian wine, within the walls of a noble hall, in a dim city we sat, at night, a company of seven. And to our chamber there was no entrance save by a lofty door of brass; and the door was fashioned by the artisan Corinnos, and, being of rare workmanship, was fastened from within. Black draperies likewise, in the gloomy room, shut out from our view the moon, the lurid stars, and the peopleless streets; but the boding and the memory of evil, they would not be so excluded.' Although there were clubs in these classic lands, generally speaking, there were no club-houses. Buildings of this kind were indeed not so necessary in Greece and Italy, where men could meet in the shade of a temple or at the baths, as in England, where the climate is unfavourable to open-air lounging.

To pass from Greece and Italy before Christ to England in the reign of Henry IV. is a long step. Clubs seem to have become extinct in the interval which divides these distant periods, for the secret societies of the middle ages were hardly clubs, even using the word in its broadest sense. They were rather associations formed to hand down from age to age some secret, and the social idea was altogether absent from them. The first definite information we have of using an English club is given to us by Thomas Ocleve, the poet, who was born about 1370. This early club was called 'La Court de bone Compagnie,' and it is probable that it included among its members Chaucer and Ocleve himself. Ocleve sent to one Henry Somer a metrical notice of a kind of club dinner at which he was to occupy the chair:

For the dyner arraye
Ageyn Thirsday next and nat is delaye.

There is besides in existence a remonstrance from Somer at the social excesses of which some of the members would seem to have been guilty.

Although clubs were revived thus early, the word club did not then exist. It is from an Anglo-Saxon verb *clofan*, meaning to divide expenses; but the first time the word is used by an English writer is in 1659, when Aubrey the antiquary writes: 'We now use the word Clubbe for

a sodality held in a tavern.' The same author mentions a ballot-box: 'Here we had (very formally) a balloting box, and balloted how things should be carried.' During the reigns of Elizabeth and James I., a large number of clubs arose, some of which have become famous, owing to the great men who were members of them. First among these was the brilliant society which met at the Mermaid Tavern, of which Shakespeare and Ben Jonson were members. Its doings are described in a letter from Beaumont to Ben Jonson:

What things we have seen
Done at the 'Mermaid!' Heard words that have been
So nimble and so full of subtle flame,
As if every one from whom they came
Had meant to put his whole wit in a jest,
And had resolved to live a fool the rest
Of his dull life.

The meetings at the Mermaid have always been an attractive subject for poets. Browning has written of them; and there are the lines of Keats:

Souls of poets dead and gone,
What elysium have ye known—
Happy field or mossy cavern—
Choicer than the Mermaid Tavern?

An earlier club than the Mermaid was the 'Apollo Club,' almost the first of its kind. It met at the tavern with the sign of the 'Devil,' in Fleet Street, and was presided over by Ben Jonson himself, who, in his *Marmion*, makes Careless say he has 'come from Apollo.'

From the heaven
Of my delight, where the boon Delphic god
Drinks sack, and keeps his bacchanalia,
And has his altars and his incense smoking,
And speaks in sparkling prophecies.

During the Commonwealth arose the famous 'Rota Club,' which was formed for the propagation of republican opinions. It numbered amongst its members the most illustrious literary men of the time. There were Milton, Harrington (the author of *Oceana*), Andrew Marvell, Cyriac Skinner, and Nevill. Cecil Hay, in his work on Modern Club-life, mentions the Rota as represented now by 'those compromises between public-houses and debating societies known by the name of Discussion Halls or Forums, of which a certain establishment yeclapt "Cogers' Hall," in Shoe Lane, Fleet Street, may be mentioned as a specimen.' Alas, the Cogers' Hall is no more! The 'Sealed Knot' was the opposition club to the Rota. All its members were Royalists, and organised in favour of the exiled Charles a general insurrection which never took place.

From this time the decay of the old tavern clubs set in. Gradually clubs began to conceive the idea of having buildings of their own, and the old inns were deserted. A Club-house was founded in Pall-Mall in the reign of George III., and became the forerunner of that great series of club palaces which lends to not a few of the streets of London whatever magnificence they can boast. Some of the clubs still existing link the new era of club-life with the old. The Cocoa-tree Club—of which Defoe wrote, 'A Whig will no more go to the Cocoa-tree than a Tory will be seen at the Coffee-house of St James's'—has its house in St James's Street; and White's Club, founded nearly two centuries ago, is still popular.

One can well imagine how great would be the astonishment of the original members of one of these old institutions if they could see the changes which have been wrought in the places in which they must have passed many happy hours, and for which they could hardly fail to feel some affection.

A SOLDIER AND A GENTLEMAN.*

CHAPTER XV.—THE END.

MEANWHILE, Ferrers' destiny hung in the balance in the library of Dawlish Place, and there is small doubt but that the scale in which were his qualities and pretensions would have kicked the beam had it not been for Lord Debrett. Mr Drumly stood his friend, as he had promised, but his friendship would have availed little against the steadfast opposition of Mr Drew. Drew was the senior partner and trustee, and he made the most of his position. Moreover, he was a hard-headed man of business and of the world, who, notwithstanding his manner of genial good-fellowship, had no great softness of heart; and, being a married man of many years' standing, he had a suspicion of sentimental love affairs. In winning this difficult and obstinate person to a favourable view of his comrade, Lord Debrett showed a shrewdness and a worldly wisdom which excited Mr Drumly's admiration.

'No,' said Drew; 'I can't see how we can conscientiously entertain the idea at all. Indeed, frankly, I may say it appears to me an impudent and preposterous pretension. You are aware, of course, Lord Debrett, that Miss Dawlish is her father's sole heir, and that—that, in short, she ought to look very high indeed for a husband.'

'No doubt, Mr Drew,' said Debrett. 'But if Miss Dawlish—as Mr Drumly assures you—wishes to look no higher than my friend?'

'Oh, she's an inexperienced girl, and she'll grow out of that.'

'She has her father's temper, remember,' said Drumly, 'and he was high-spirited and self-willed, as you know, Drew. Besides, you mustn't forget that though he desired a certain marriage for her, he insisted to us that there must be nothing like coercion.'

'Coercion? Who wants coercion, Drumly? I only want the girl to wait—till she really knows her own mind.'

'Certainly, Mr Drew,' said Debrett; "'Wait' is the word; there's no immediate hurry. I only ask you to give my friend a chance—a sufficient chance. And let me say this; look as high as you like, you won't find a better fellow, all round, than Ferrers. You will admit, Mr Drew, that I know something of Society?'

'Certainly,' said Mr Drew.

'Well, I prefer Ferrers for a friend to any man I know. I have known him for twelve years—I have seen him under all sorts of circumstances, in barracks, on the march, and in battle in the Soudan, and at home with my own people (he has often stayed with me). He is a staunch comrade—and a staunch comrade can't miss being a good husband—he's got all his wits about him'—

'And he has the finest health,' put in Drumly.

'Yes,' said Debrett; 'sound as a bell, and as hard as nails.'

'Oh,' said Drew, 'I've nothing to say against him as a man.'

'There is nothing against him,' said Debrett, 'but this affair, and that, as you've heard, he was led into. It was a pity; it was wrong; but he has come out of it as well as any man could.'

'Yes,' admitted Drew, 'all things considered I think he has. But you see the thing is he has neither property nor prospect, and, of course—well, he is not what we call a gentleman.'

'That depends,' said Debrett, 'on what you mean by a gentleman. If you should happen to mean a man that would never do anything mean and that always keeps his head, and that can reckon back his people as having been of the same sort for hundreds of years, then George Ferrers is a better gentleman than I am. And as to property—well, he's not rich, and his people are not rich; but they have owned and cultivated the same land since the old days of fighting between England and Scotland.'

'Then,' said Drew, with a final burst of petulance, 'why doesn't he go home and inherit his father's farm and not come here asking for heiresses?'

'No, no,' said Drumly, 'do him justice, Drew; he has not asked for anything; it's we are asking on his behalf.'

'Then about prospects,' said Debrett, keeping to the subject—'there, Mr Drew, you might help him.'

'Me?' exclaimed Drew.

'You might offer him,' said Debrett, 'a place in your bank: he can tot up figures like one o'clock.'

Drew stared from Debrett to Drumly, and Drumly laughed 'Ho, ho!' in the depth of his beard.

'I'll be responsible for him,' said Debrett, 'to any amount.'

'My dear Lord Debrett,' said Drumly, 'you don't quite understand my partner's astonishment. Banking is something like soldiering: you must be put to it, or take to it, pretty young to make anything of it. No; I think the prospect for your friend is to look after an estate, because he understands farming.'

'Yes,' said Debrett, 'I suppose that's better.'

'I daresay,' said Drew lightly, as if it were no concern of his, 'he might get a situation of that sort.'

'I hope he will,' said Drumly: 'and I have a definite proposal to make, Drew, to that end. We can't let Sir William's mortgage be foreclosed: we agree on that. We must take it up. But we can't leave Sir William in charge of the estate. Suppose we put Mr Ferrers in charge, and see if he can make it pay?'

That looked merely like business; and Drew, after pulling his whisker a moment, said: 'I have no objection. Very well now; I agree to our taking up the mortgage, pensioning Sir William off for the sake of his brother, and putting Mr Ferrers in charge of the estate, on condition that I hear no more of his marrying Miss Dawlish.'

'You shall hear no more at present,' said

Drumly: 'there is plenty for him to do before he thinks of marrying.'

'Let me only ask this of you, Mr Drew,' said the wily Debrett: 'permit me and my friend Ferrers to visit your house.' Debrett, of course, reckoned that if his friend were admitted to Drew's house, he could hardly be forbidden to speak to Miss Dawlish, who lived there.

'Always be delighted to see you, my lord,' said Drew, 'and I can't in common courtesy refuse to see your friend.'

It was impossible to insist further; and Lord Debrett was withdrawing somewhat disappointed with the result of his efforts on Ferrers' behalf, when Mr Drumly took his arm and drew him aside, and said: 'Don't be impatient; we'll conquer Drew. He thinks he's as sharp as steel, but he isn't; he thinks he can see round a corner, but he can't. I believe in your friend; he'll come out all right; and I'm going to make him my heir to-morrow.'

It is not surprising that next morning before breakfast (the party was to break up immediately after) Drumly should have got out the pony-chaise, and, accompanied by Dolly and Debrett—of course, quite without pre-arrangement—should have driven down the avenue and out by the great gate towards the little inn on the edge of the common. Nor is it surprising that before they had been well on the road they should have encountered Ferrers, who looked very shame-faced. Like an honest man, he attempted no limping excuse of his being found where he was; and Drumly, leaving Debrett and Dolly to drive on a little together, walked along the grassy margin of the road with his arm in that of Ferrers, and told him all the news of the night before. The proposal that he should take charge of the estate Ferrers unhesitatingly accepted, inwardly resolving that at any cost he would be found equal to the confidence placed in him.

'It is awfully good of you,' said he to Mr Drumly, 'to take so much trouble for a man about whom you know next to nothing.'

'You see,' said Drumly, with a grim smile, 'I have the misfortune to like the man and believe in him, and so has Lord Debrett. You have really to thank him more than me for winning Drew over to this arrangement. And this done, it depends on yourself, my son—perhaps a little on your good friend Debrett—how all the rest follows.'

They then met Lord Debrett and Dolly driving back. There were no lingering adieus; for they were all likely to meet in London next day or the day after. Ferrers' heart was full: what had he done to deserve all this kindness?

'I have to thank you,' said he, gripping Lord Debrett's hand.

'Oh, it's all right, old chap,' said Debrett. 'See you in town to-morrow.'

'Good-bye,' said Dolly and he together: their hands and their eyes met, and that was all.

So they parted for a little while. They drove back to Dawlish Place, and he stood looking after them till the turn of the road hid them from sight, and then he returned to the little inn, whence in an hour or two he departed for London.

There are but these facts further to record:

Ferrers won more and more the favour of the business-like Drew; within a year he had brought the administration of the estate and the Home Farm to a surprising pitch of order and economy; in little more than the year he was overwhelmed by the receipt from Drumly of the title-deeds of the estate—Drumly had bought the estate, and the one condition he attached to his gift to Ferrers was that the young man should take the name of Dawlish, so that his late partner's desire might be fulfilled that the Dawlish name and the Dawlish land should keep together; and within eighteen months it was announced in the newspapers that 'George Ferrers Dawlish, of Dawlish Place,' had married 'Dorothy (Dolly) Dawlish, only child of the late Robert Dawlish, Esquire, of the City of London.'

STRANGE DISEASES AND STRANGE REMEDIES.

SUPERSTITION is still rife in Ireland to an almost incredible extent. It is almost a religion with the lower orders; it is indeed part of their religion, being composed largely of an unwavering faith in the power of prayer to heal diseases; but not in prayer alone—here comes in the superstitions element, which requires that prayer should be aided by the use of some charm more or less absurd. These charms, they believe, are hereditary, descending from father to daughter, or from mother to son, but never to the same sex. Where they suppose they were originally procured, we have never been able to find out; but imagine, from the mysterious and reluctant air with which they answer such inquiries, that they fully believe that the charms were in the first instance a Divine gift.

It is strange to observe how surely an element of the ridiculous pervades all Irish observances. In their sorrows, their joys, even their religion, a shade of the grotesque is sure to be found; and that 'heritage of woe,' the bodily sufferings of poor humanity, are turned almost into a farce, when they describe them from their own point of view, their ideas of cause and effect being of the most primitive kind. It is not very long since I went to visit a very poor woman who had been for some time in delicate health. I was surprised to find her standing at a table making some oatmeal bread.

She answered my greetings by saying: 'Deed, thin, your honour, ye find me doin' what I couldn't do this many a long day. I didn't shtand at that table to make bread for six months till to-day.'

In replying, I rashly concluded that in some of her frequent visits to the dispensary she had at last procured a bottle from the doctor which had done her good.

She sniffed disdainfully. 'The docthor is it. Ah, the docthor never done me a ha'porth o' good. I quit takin' his medicines entirely. It was a while ago; I was that bad in me *hart* that I thought I'd do no good at all, at all. It'd be here, it'd be there within in me. I never knew where it'd be; but it wasn't in the right place at all. Well, ma'am, I heerd there was an ould woman beyant at Cruxty that had a charrum for the like o' that, an' done great cures. "Wid the help o' God,"

says I, "I'll go into the town on Monda' to the market, an' maybe I'll meet wid her there." It was long since I shtood in the market indeed; an' whin I got in, I was fairly *bet up* wid the inward pain. Well, I met the ould woman, an' axed her woud she do the charrum for me. "Throth, I will, acushla," says she, "wid a heart an' a half; but it's only ov a Thursda' I can do it; so, av ye'll come to me next Thursda', I'll be ready for ye, an' wid the help o' God, ye'll be cured." "Oh wirra, wirra!" says I; "I couldn't go next Thursda', for Mick has to go to the fair at Bally-James-Duff wid the pigs, an' he'll want the cart; an' if I have to wait till the Thursda' affther, it's dead an' buried I'll be." Well, whin she seen the shtate I was in, an' how bad I looked, she studied a while, and thin says she: "Well, we'll see what we can do, an' maybe, wid the help o' God, it'll come out right. On next Thursda' at twelve o'clock be thinkin' o' me," says she; "be thinkin' o' nothin' else but me, an' I'll say the prayer for ye, an' maybe it's what it'll save ye, as ye can't come. But ye'll have to come the next Thursda', for it must be done three times."—Well, your honour, I woke this mornin' [this *was* Thursday] as wake an' donny as ever, an' at twelve o'clock I began to think o' the ould woman at Cruxty. I bethought an' I bethought of her long enough, an' affther a while, "Biddens," says I, "wipe that table an' put the male on it an' bring in a sup o' wather."—"Oh mamma," says she, "you're not going to make bread, are ye, an' you not able to shtand." "Do what you're tould, child," says I, "an' lave me alone." Well, wid that I got up an' wint to the table where your honour found me, an' med the bread, an' sorra a ha'porth on me the worse. I'm thinkin' the charrum's workin', an' next Thursda' I'll go to her meself.

I left the cottage musing over what she had told me, and much interested in this new faith-cure; and the following week went to see her again to hear how the charm progressed. She had been to Cruxty, and had seen her old woman. All that occurred there was that the old woman had taken both her hands in hers and repeated a mysterious form of words over three times. What the words were, no one knew but the old woman herself, who received the formula from her dying father, and had them written out to be sent to her son in America, on her own death. But they are believed to be a prayer.

My friend did not look very much better; but she said the charm was working; but as it took as long to cure you as you were ill before you tried it, it would be long before she could expect to be quite well.

As I spent that summer away from home, some months elapsed before I saw her again. Soon after my return in the autumn I looked in one evening to see how the charm was progressing. I found her as usual seated by the fire on a low stool, leaning against a sack of chaff. The 'childhre' were all out, and her only companions were some hens pecking about the floor. Of course my first inquiry was for her health.

"Deed, thin, your honour, I'm donny enough; but I'm bether nor I was; an' wid the help o' God, I'll be gaily in short."

"Has the old woman's charm not cured you yet, then?"

'Is it th' ould woman's charrum? Ah! sure that done me no good. I'm thryin' another wan now. Maybe it wasn't the right cure for me. Anyway, I wasn't gettin bether, an' I heerd ov a man up at Ballynagrancy has a grand charrum; an' ye needn't go to him yerself naither, for it's all done be manes ov an egg.'

'An egg!'

'Yes, your honour; an' I'll tell you all about it. I sent Briny to him wid the egg last week; an' where did he find the man but out rapin' in the field. So he threw down the rapin'-hook. "Come an," says he to Briny; "come over to the hedge there.—Now, gossoon," says he, "tell me is it the *hartache* your mother has?"—"Sure, I dunno," says the gossoon.—"Well, gim me the egg," says the man; "the *hartache* is the only thing I have a cure for, an' I'll know soon enough if that's what it is, whin I take the egg in me hand."—Well, ma'am, he tuk the egg from Briny, an' shut his hand on it, an' began to say the prayer. Well, your honour, if it wasn't the *hartache* I had he wouldn't be able to say wan word o' the prayer! But it's the *hartache* I have, sure enough; for he said the prayer all through; an' then he gev the egg back to Briny, an', savin your presence, ma'am, the egg all shweated in his hand.—"Now, Briny," says he, "take that egg back to your mother an' tell her to boil it on the fire; but nothin' must come betune her an' the fire while it's boilin'; an' when it's boiled, she must take it off the fire an' open it; then she must throw the first spoonful athrough the house an' ait the rest ov it. An' she must ait three eggs like that in three weeks; an' plaze God, she'll be cured ov the *hartache*."

'And did you follow all his directions?'

'Throth I did, your honour. I'm affther aitin' the second egg yestherda', an' I think the charrum is workin' well in me. This mornin', when I woke first, I felt terrible bad. I couldn't scarce breathe, an' I sat up in the bed to thry to get aise. Well, ma'am, when I sat up, me hart gave a great lep an' fell down into me ribs; it shtayed there a while, an' then it gev another lep an' got round into me back. Well, it played away a while in the small o' me back, an' then it crep' round in under me arrum an' fell back into its right place. So that's what the charrum done for me, ma'am; an' plaze God, now me hart is in its right place, I'll soon be cured all out.'

Poor old woman! her belief in charm and charm-worker was unbounded, and we knew not whether to admire most her amazing credulity or extraordinary ideas of anatomy.

But credulity and superstition are not confined to the lower classes alone. I think a story told me as an actual fact by an educated lady, the daughter and sister of a clergyman, might very well be classed with our poorer friend's as an instance of both. We were discussing the subject of charms, and I was surprised to see that she believed in them herself, as did also her reverend brother.

'I cannot doubt what I know to be true myself,' she said; and told us the following tale, which I give in her own words.

'There was a man in our village, a respectable shopkeeper, who was afflicted with an enormous tumour in his cheek. I well remember the feelings of awe and curiosity with which I used

to inspect his profile in church when I was a child. He sat a few pews in front of us, and I could not resist the temptation of watching him all through the service, and looking for the grotesque effects of his enormously exaggerated cheek. His infirmity seemed to increase with years, and the poor man was a frightful object. One day not long ago I passed a man in the village street whose face I seemed to know, and yet I could not think of his name. It suddenly dawned upon me it was Mr — without his swollen cheek! I could hardly believe my senses, and followed him into a shop on purpose to see if it really could be the man I had seen only the Sunday before, so marvellously changed in such a short time. Yes, it certainly was Mr —. He addressed me first, saying: "I suppose you hardly recognise me;" and he then told me how he was cured. It was by a charm! He was advised to go out the first night the new moon was visible, and after saying, "In the name of Father, Son, and Holy Ghost," to wave a dinner plate round his head nine times towards the new moon. He did so; and in the morning his tumour had completely disappeared!

Such was the tale told to me and implicitly believed in by an educated Irish lady.

The lower orders of Irish are as a rule rather hypochondriacal, and they are fond of trying peculiar remedies for their ailments. A favourite poultice for wounds is a paraffin candle scraped and some cabbage, all boiled together. A simple but rather unpleasant remedy for a cut leg was recommended to an old man—it was to sit with his leg in a boghole all night. This he tried with perfect success. His leg got quite well; but as he died of bronchitis a few days afterwards, he did not long enjoy his 'perfect cure.'

A carpenter who in chopping wood had cut a slice off his shinbone with the hatchet, first applied a poultice of nettles and salt. This not healing it immediately, he put on a bandage soaked in Venice turpentine. As the wound remained obstinate, and even got worse under his gentle treatment, he determined to be firm with it, and show it he would stand no more nonsense, so he burned it with blue-stone! He did not lose the leg; but it did not recover until less heroic remedies were used.

A poor man suffering from inflammation of the eye caused by a thorn, had blue-stone blown in. He *did* lose the eye.

If they have peculiar cures, they have also most peculiar diseases. A respectable coachman complained of illness, and described his symptoms thus: 'A creepin' an' a crawlin' in the furnace of his head, a bingin' an' a bingin' in his brow, an' a dazzlin' in his eyes.' It must be a terrible complaint!

A favourite remedy for every kind of internal pain is hot vinegar punch; indeed, vinegar taken either cold or hot is considered almost a specific for everything. It must be comforting in some cases! It is much used for a 'squeezein' on the hart,' which is the commonest complaint of all.

They are a kindly and sympathetic race, always ready to help each other in cases of sickness, either with nursing or good advice; but I fear in most cases the remedies prescribed are far worse than the disease.

A village tragedy occurred in my own know-

ledge. A young blacksmith whose wife had presented him with their first baby was much horrified to find that the infant had been born with teeth. So unusual an event must be unlucky; so the poor baby's teeth were drawn by the unskilled hand of the blacksmith. The baby died; and the mother, shocked and grieved by the scene, died soon afterwards. 'But sure, he'd never have had luck or grace if them unlucky teeth hadn't been dhrew.'

Of course their terror of a dog's bite is unbounded, and they have many superstitions about the danger of it and the best means of averting hydrophobia. A pet dachshund being seized with a sudden and unaccountable desire to taste human flesh, tried a bit from the leg of a boy passing by. The boy took it good-humouredly, and did not seem unduly alarmed, only begging the dog's mistress to give him 'a few ribs of the dog's hair' to dress the wound with. This is the commonest idea of a safeguard, and a very expensive one.

I could add many more to the list of 'strange diseases and strange remedies;' but think I have given enough instances to show the extreme ignorance and extreme credulity of the Irish. Both very ridiculous, perhaps; and yet it is touching, amid all its absurdity, to see the simplicity and trustfulness of these poor people, so humbly submissive to the 'will of God,' in which they acquiesce so patiently in sickness and sorrow; so ready to 'believe all things,' a command they most literally obey, and which is so impossible to the more educated and sophisticated class. They are, in fact, like unruly children—troublesome, warm-hearted, easily led by those they love and trust; and if fierce passions smoulder under a light-hearted exterior, ready to be kindled at a touch; yet for everyday life, 'Paddy at home' is a delightful companion; gay, sympathetic, with an inexhaustible fund of humour; above all things, fervently religious, and with capabilities of faith almost sufficient to 'remove mountains.'

A SCRATCH IN PLAY.

PART I.

Beware, my friends, of fiends and their grimaces.

Of little angels' wiles yet more beware thee.

Just such a one to kiss her did ensnare me,

But coming, I got wounds, and not embraces.

Beware of old black cats with evil faces;

Yet more of kittens white and soft be wary.

My sweetheart was just such a little fairy,

And yet she well-nigh scratched my heart to pieces.

O child! O sweet love! dear beyond all measure,

How could those eyes so bright and clear deceive me?

That little paw so sore a heart-wound give me?

My kitten's tender paw, thou soft, small treasure,

Oh! could I to my burning lips but press thee,

My heart the while might bleed to death and bless thee.

I AM very sorry to have to say it, yet I must speak the truth even of her I love most; and I repeat, what I always have maintained, not only that she was completely in the wrong, but that she ought to confess it.

We had loved each other all our lives. Our fathers were old brother-officers and the closest of friends; and each being widowed and the father of an only child, what was more natural than that when they left the service and her father settled on his estate, my father should

take up his quarters in a pretty cottage on his friend's domains? What plans the two old fellows used to make for their children's future! I, of course, should enter the old regiment; and she, of course, should marry me. Alas! I myself was the cause of the shattering of the first dream; and subsequent events very nearly put an end to all chance of the second's being realised.

When I had reached the age of seventeen, when my brain ought to have been on fire for the sound of the drum, and my sleep disturbed by dreams of the glories of war, my dear old father discovered—through an intolerable odour which pervaded the house, and was traced to a mysterious box in my bedroom—that my mind turned towards science, and that a macerating pot or the dissecting table was more to me than the extermination of the entire British army. I often sigh now as I think of the sad head-shakings the poor old gentlemen must have indulged in as they discussed my extraordinary fancy over their wine; and I know that my little playfellow, Avis, treated me to a good deal of contempt when it was confessed that I actually turned from 'the only profession suitable for a gentleman,' and deliberately chose that of a mere sawbones.

Poor old father! He loved me too well to oppose me; and one dull autumn morning I left the old home to enter upon my studies at the university of Edinburgh. Why did I go to Edinburgh, and not London? Well, I think it was partly because I had a feeling that I was breaking with all the old life; and therefore wanted to put hundreds of miles between me and the old home, as I had put hundreds of difficulties between my father and the realisation of his old hope.

How well I remember my arrival, that cold, gray morning, in the beautiful city! I left my luggage at the station, and climbed up the steep hill that leads from the land of steam and noise to the most beautiful street I have yet seen in my wanderings. How grandly, away to my left, rose the magnificent 'Old Town,' topped with its castle; and to my right, the gardens and splendid buildings of Princes Street; while behind me couched the 'Lion,' watching over the safety of the maiden city! How lonely I felt among it all—how utterly lost! I think that, if all had approved my design to become a doctor, I should at that moment have turned and gone back to England, and promised my old father to do anything he might wish. But the vision of a child with long flowing hair, defiant face, and hands fast clasped behind her, came across my mental vision. She had refused to bid me good-bye. How she would triumph if I came home again, my work undone! No! I must go on. So I plucked up heart, and wandered on alone in that unknown city, looking for a place wherein to lay my weary head. Before long, I found lodgings, and had my things removed to a little street near the theatre. And not many weeks had passed before I was as happy as a king, drinking in all the new mysteries of my chosen profession. Ah! that first enthusiasm, why doesn't it last? Why, as the years go on, does there come in its stead such utter loathing of each fresh step? I did not in the least mind the dissecting room; but the operating

theatre—the hospital—the horror of it all! Well, it is over; and to that supercilious little figure with the flying hair and the clenched hands do I owe the obstinacy that carried me through these four years of sunshine and shadow. Give in, when she had said: 'I *know* you will hate it. I hope you will give it up!' Shall I give it up? Never! The thought of the look of triumph I should see in the eyes of that young girl acted as a spur to me.

I worked on. I hardly ever went home; for I was really 'keen on' my work, and spent most of my spare time among the foreign hospitals and schools. Then a serious illness, coming upon me just as I had completed my course, made me decide, on my recovery, to go as doctor on board a great ship sailing to the other ends of the earth. So, thanks to one thing and another, it was not till the slim, awkward boy of eighteen had changed into a great weather-beaten man of four or five and twenty, that I once more stood on the old walled terrace of the home of my little love. And by my side was the little love herself! And *such* a little love! At twenty she was no bigger than she had been at fifteen; but oh! so much prettier. The hair that had then been often dragged back into a stiff pigtail now wandered in wondrous waves over her little head, poised like a flower on her sweet neck. No more ink-bespattered pinafores and scratched hands; no more long thin spindle-shanks showing under a short and skimpy skirt! No; she was as dainty as a fairy, and took now as much pains to adorn her already perfect little self as at one time she had seemed to expend on trying to personate a scarecrow. Yes; I stood by her once again, and knew that I was likely to be near her for the rest of our lives. For my dear father was getting old, and longed to have his only son beside him. So I was only too delighted when the offer came of a practice in the neighbourhood. Yes, I had come home 'to live and die,' as my aged nurse cheerfully put it, in the home of my childhood; and I could hardly believe I was not a child again, as once more I settled into the well-known routine: dined with the two old gentlemen; strolled out as of old on the terrace with my early playmate; climbed at night once more to the familiar room under the thatch; and listened as in years gone by to the murmur of the stream that ran from her home to mine. Yes, it was all the same! The old women seemed not a day older; the trees very little bigger; the river just as it had always been. Only, how different it all was: how different the thoughts that thrilled through my brain—the feelings that throbbed in my heart!

Well, well, we need not go over all that strange, miserable, happy time when my mind was filled with doubt and fear; when I knew not whether I was to be the most blessed or the most wretched of men; whether I was to stay contentedly at home for the rest of my life, or start once more on my travels to heal a broken heart as best I could among foreign lands and unknown faces. I sometimes fancy that if we could but turn back the 'forward-flowing tide of time,' I would live these weeks over again.

But at length they came to an end. One still June evening, when the moon was but a crescent in the sky, and the nightingales were singing

with all the strength of their tiny throats and fervour of their great hearts, my little love laid her golden head somewhere about the lower edge of my breast-pocket, and gazing up in my face, promised to overlook the fact that I was only a sawbones and no gallant officer.

'Well, you see,' whispered the little voice, 'you are so big and strong and handsome, it is no use trying to fight against you. I love you, I love you! and after all, you are my own dear old Clinton; and I'd marry you if you were a sweep, which is even worse than a doctor.' And the brave blue eyes looked up at me so proudly and so trustingly, that I thought no man had ever before such loving glances cast upon him.

Oh, what a happy time we had! I thought that trouble could never touch me more. As I strode home through the soft air to tell my father the glad news, I felt like an archangel.

Yes, I fancied my troubles were at an end—that I was going to be blessed beyond all human flesh; but I did not yet realise what it is to be an engaged man! No sooner were we safely and firmly betrothed, than my young lady contracted such a habit of flirting as made me stand agape. I maintain that she flirted. *She* insists that she did not! She says she was only making herself agreeable for the sake of my practice. She repeats that she smiled on the curates, youths from Oxford, retired military men, &c., not as men at all, but purely as possible future patients. Future patients! Did I want them bought with her smiles? Still, such an injured saint did she look when I ventured to expostulate, that I hardly knew how to bear myself; and I used to wonder whether I really was the most suspicious brute on the face of the green earth.

At length matters reached a climax, and I turned at last.

It was in the week of the 'Lawn Tennis Tournament'—the one great excitement of our little country-side—when a young hussar made his appearance, and contrived to get himself drawn as her partner in the doubles! *She* declares I am simply talking nonsense when I assert that he *got* himself drawn as her partner; and she says that it is all done by lots, and that people *must* play with just whoever falls to their lot! Well, that is neither here nor there. She need not have behaved as she did. He did not live in these parts of the world: he could not be considered as a possible patient; yet the interest she took in him was most marked. If it is a fact that she could not help having him for her partner in the 'doubles'—as they call the thing—need she have stood watching him with all her eyes in the 'singles,' clapping her hands at each stroke he won, or have been the first to congratulate him the moment he had put on his abominable loud 'blazer' and marched off the field, or court, victorious?

I do not play tennis, having more important matters to attend to; nor do I dance particularly well; still, at their insufferably dull 'Tennis Ball,' she need not have thrown me over for him in the pronounced way she chose to do.

'Oh, Clinton, may I give Captain Smyth one of your dances? You won't mind, *will* you?'

'Oh, certainly not; give him the lot, if you like,' I answered blandly.

I did not know till that moment that the sweetest of blue eyes can flash sparks of ice; but I saw them do it then.

'Oh, thank you *so* much.—There, Captain Smyth; that is delightful: you can have three more than I promised you at first.'

And without waiting to listen to my angry expostulation, she sailed away on his arm. I knew I had been rude, and wanted to apologise; and tried hard to catch her eye as she swam round with the handsome captain, who *could* dance. But never once were the long dark lashes lifted, never once did the old smile play across the sweet little face.

I went home utterly wretched. Ah, how the little paw could wound my big stupid heart! I lay awake nearly all night, and during the long hours I made up my mind to hasten, the very first thing in the morning, to 'make friends' with her. I should tell her I was sorry I had been rude, but should also make her understand that I considered I had a good deal of cause to feel injured.

'Clinton,' she began very quietly the moment she entered the room, 'I am glad you have come. There are some things I must say to you. I consider that the way in which you have behaved since our engagement has been most humiliating to me.'

'To you! I do not see what cause *you* have to speak,' I broke out.

'*I am* going to speak,' her soft, even voice went on. 'I consider your unreasonable jealousy as nothing short of an insult. If you cannot trust me, you had better bid me good-bye. There can be no happiness in a marriage without absolute trust.'

I hardly know what I said then, whether I pleaded or upbraided. I remember little of what befell till I found myself striding through the fields, their corn-flowers blue like those angry eyes, and their poppies bright like her scornful red mouth.

Was it all at an end, then, the dream of my life? Yes, of course it was—over, all over! I must get away, away back to the sea and the wild strange lands: away, somewhere, anywhere—from all this. But my poor old father! I could not leave him. I must not leave my work: some of my cases were in a critical condition. There was no escape. Here I must stay; meet her constantly; shake hands with her; and yet be as if the world stretched between us. And the dreadful part of it all was that she seemed not to care one little bit. She was the same bright, merry, dainty little creature that she had always been. Why was she so cruel? Why would she not once look at me with a glance of pity, love, remorse? How gladly, at her smallest overture of grace, would I have cast myself utterly on her mercy, and vowed anything she chose to demand of me. But she gave no sign; and I was too proud to approach her unless she herself seemed to summon me.

What a wretched time it was! How fiercely week by week did I try to harden my heart against her! But everything conspired to make that impossible. Hardly a cottage did I enter but I heard of her loving-kindness. She seemed to go about like a sunbeam, smoothing coarse pillows, comforting sad hearts, calling smiles to

parched and fevered lips, and looks of love to heavy eyes.

How was it that she, who could be so tender to others, could so hurt the heart that loved her? How *could* she keep up our quarrel all this time, when she must see how it was wounding me, killing me? If only she would say she was sorry she had vexed me, I should not whisper a word of blame. But say it she would not. And so the summer passed: autumn came with its storms and decay; and yet we were no nearer being friends again.

PART II.

Ye who have scorned each other,
Or injured friend or brother,
In this fast-fading year:
Ye who, by word or deed,
Have made a kind heart bleed,
Come gather here.

Let sinned against and sinning
Forget their strife's beginning,
And join in friendship now:
Be links no longer broken,
Be sweet forgiveness spoken
Under the holly bough.

So the wretched months passed till mid-winter was reached. And what a winter! Long before Christmas, the snow lay thick on the ground; and my poor patients learned full well the joys of a 'real old-fashioned winter.' I had enough and more than enough work to do; but I was thankful for it. Only in helping and relieving the sufferings of others could I succeed in forgetting my own pain. As the dull days dragged themselves along, one of my favourite patients began to fade away; and at length I had to face the painful task of telling her that, ere the new year came, she would have to enter on the world of the unknown. She was a decent woman, the wife of a dissipated husband, for whom she had toiled till her poor worn-out body could work no more. And now she lay apparently dying in her cold little room, thanking God each day that none of her children had been left to struggle on without her.

'Except my poor big child,' she said, with that spark of pathetic humour one sees now and again among our rustics—chiefly among the women. 'But I seem to have brought him up very badly, doctor. I must just hope he may be able to bring himself home at last.'

'Is there any one you would care to see, Mrs Clerk?' I asked her, late one bitter, cold afternoon.

'Why do you ask, doctor? Is the end at hand?'

'I can hardly say that. Yet, if there is any one I could send for to come to you, it might be as well not to put it off.'

A light gleamed over the tired, plain features. 'Oh doctor, if I *could* see the little Lady, I think it would make it easier for me.—But'—and the weary eyes wandered to the uncurtained window—'it be getting dark, and the snow lays thick on the ground. Her couldn't come now.' And she sighed that patient sigh that speaks of a life of renunciation.

'Have you no relation, no sister, you would care to see?' I asked.

'No, sir, no. I'd have liked to see the dear Lady this very night. I think if she had sung

me to sleep, I'd have woken better.—But it is no use. She couldn't come out, a night like this.'

'I'll fetch her in my sledge,' I said.

The tired eyes opened with such a glad light, that, had it been Queen Victoria I had promised to snatch off her throne and bring to this poor cottage, I should have had a try to fulfil my word.

'Will you, sir—oh, will you?'

'Yes.'

And away over the snow I dashed, nor paused to think till I drew up at the door of the Manor.

'Is Lady Avis in?' I asked the footman; and made my way unannounced to the drawing-room. The lamp was burning, subdued by its flower-like shade: the tea-table was drawn up near the fire; and she, in one of her soft, silken tea-gowns, was standing warming one perfectly shod little foot at the flame of the blazing logs which roared up the chimney and danced on the steel grate. Close to her sat a young fellow whom I had never seen. I learned afterwards that he was a cousin, who, during the years I had been away, had been like a brother to her; but I did not know this then.

Did her face grow pale in the red light as she saw me enter? It seemed so; yet she came quietly forward and offered me tea.

'No, thank you,' I said as shortly as I could; 'there is no time for tea. There is a woman dying who wants to see you.'

All her face grew soft in a moment. 'A woman dying! Oh, where? What woman?'

'Mrs Clerk, at the old Farm cottages. Will you come? The sledge is there. It will save time if you will come in it with me now.'

'I will come.'

'Nonsense, Avis,' cried the young man. 'It is sheer nonsense to think of going out in such an evening in an open sledge. The brougham can be brought round in twenty minutes.'

'Are the horses roughed?' I asked.

'No,' said Avis; 'and it would take a long time to get them ready. I will go with you.'

'And I shall wait outside, as I don't suppose the footman relishes holding the horses in the snow.'

'I have no doubt he has sent for a groom,' said Avis, her blue eyes turned coldly away. 'You had better drink some tea.—Harold, come with me for a moment;' and she swept from the room, the young man following. Drink tea in the room where that fellow had been! Never! I flung out of the room, and hastened into the night-air. A groom had relieved John Thomas at the horses' heads; and I had the gratification of observing the contemptuous looks with which he surveyed my scratch team and makeshift sledge.

A courteous footman in the hall asked whether I would not step into the library, and threw the door invitingly open, displaying the wainscoted room, on whose old oak carvings and brightly-bound volumes the firelight danced deliciously. Holly and mistletoe glistened and twinkled from all corners. It was Christmas eve.

'No, no; I will wait here,' I answered curtly.

At this moment, her light footstep sounded on the stair; and her ladyship herself tripped into

the lamplight. And what a ladyship! She had not even taken time to change her dainty shoes; but her silken dress was covered over with her great white mantle. On her soft fair curls rested a little white fur cap; and about her neck was bound a feathery boa like a glorified snow-flake. Her hands were hidden away in a snowy muff. Harold was with her.

'Well, my snow-queen,' he was saying, 'you will frighten the country folks if they meet you like that. You look as if you were playing at Queen Matilda escaping from Oxford Castle.'

'Clever boy,' laughed Avis, 'to remember his history so well.'

'Meantime, history is repeating itself in the most commonplace fashion in Mrs Clerk's cottage,' I remarked grimly. 'Perhaps you had better not come. You look too gorgeous for that poor room.'

'Am I? I never thought. This was the warmest, so I put it on,' she began, her great eyes full of distress.

'It's all right, dear,' cried Harold; 'you know they love you when you look beautiful.'

'They must always love her, then,' I thought within my bitter heart.

In another moment I was seated beside her; the horses' heads were let go; the bells jangled out; and the sledge slid over the snow. It was a glorious night. Above us stretched the sapphire sky, gemmed with myriads of flashing stars; while all around us was silence and the gleaming snow. All the well-known landscape was rendered strange and unfamiliar under its pure covering—as a dear dead face is rendered awesome under the thin sheet we spread after death.

The bells jangled; the horses' hoofs clinked against each other now and again as the sledge sped on; but all else was silent. Not a word did we speak. I caught a glimpse of her face once as she turned it to watch a great white owl slowly gliding over our heads. How white and still the beautiful face was! Was there a tremble about the mouth?

On we sped. When we had started, my heart had been ablaze with hot anger. Who was this youth who had usurped my place? Why had I been cast out of my place? Why had we quarrelled? Why had we not made it up again? It was all her fault—all. I had been ready to make friends, yearning for the old companionship, breaking my heart for her cruel sake; and she had never cared in the least. Cared! She had been filling up her time and thoughts with this young Herbert—Harold—whatever his name might be, and probably a dozen more. She was a mere flirt. In her heart she still despised me for being a doctor—'Only a sawbones,' as she used to say. She was the daughter of the lord of the Manor: I—well, I was as good as she. I was a man with a man's heart, head, hands. She had no right to play with me. Had she played with me?

At that moment I caught the pure profile against the lamplight. She had leaned suddenly forward, and was gazing ahead with a strange, far-away look in her eyes. She worthless! She a flirt! How pure and cold she looked! pure like the snow; yes, and cold like the snow. Ah no, not cold. With those deep dark eyes, those sensitive nostrils, that exquisite mouth. And

yet why not? It is ever the most beautiful women who are most cruel.

And so went on the foolish, proud, unreasoning thoughts within my brain, while my heart grew warmer in its love for her at every stride the horses took. How could I help loving her with her dear presence so near me, her garments touching me, her breath rising like incense to heaven through the clear air?

Oh, what a long drive! What a sad sore heart! I felt as if I could bear it no longer—when the welcome cottage came in sight. Silently we drove up to the door.

'If you will go in, I will drive on, and leave some medicine for another patient, and come back for you,' I said, breaking the silence for the first time.

Without a word, she left me.

I drove on about a mile farther, and then returned slowly through the still night. Mrs Clerk's dwelling had once been a fine old farmhouse in the days when farmers were opulent and liked their homes to be roomy. It had 'come down' in the world, however; and was now divided off among several families of labourers. But outwardly it was still beautiful to the eye. From where I sat alone in the sledge, I looked through an archway of dark yews towards the old rambling building with its low eaves and mullioned windows. The steep tiled roof was covered with the gleaming snow; the tall irregular chimney stacks rose black against the deep-blue sky; and from one uncurtained window, the ruddy light shone out upon the snow-clad lawn. How still it was! Was the whole world dead? The bells on the horses' heads sounded painfully loud as the animals moved restlessly from time to time. I felt vaguely that I ought to walk them up and down; but the spirit of stillness seemed to have got the better of all my senses. I could not move. Above was the still, silent sky: around, the still, silent world; and in my heart a strange sensation of unfeelingness. The world was dead. I was dead; everything was dead. Nothing mattered any more. I felt nothing, nothing. Why trouble whether she loved me or no? It would all be the same when I was dead. My heart was dead now. The spirit of stillness had wrapped the world in its cold embrace, and my soul was at rest within its arms. I did not mind the delay; I did not feel impatient for her return; only, I wished the horses would stand still and the bells not jangle so.

Then, all at once, through the silence stole a beautiful sound, falling like golden snow from somewhere above me. A woman's voice! Singing softly, tenderly, gloriously! I held my breath to listen. No words reached me—only the sweet clear notes; and even they seemed to come from the voice of a singer in a dream. The voice ceased. A little wind uprose and swayed the trees, as if protesting against the cessation of the wonderful music—then suddenly there came to me over the snow the sound of bells.

The time draws near the birth of Christ;
The moon is hid, the night is still;
The Christmas bells from hill to hill
Answer each other through the mist.

Peace and good-will, good-will and peace,
Peace and good-will to all mankind.

The door opened gently—closed; and, to the music of the bells, a white figure moved towards me through the whiteness. Under the arch of black yews she stepped. Did she do it on purpose? Did she know that the light of the carriage lamp fell full upon her? Did she dream how beautiful she was with the spirit of her song still on her lips; with the light of her tender action still in her eyes? She stopped and listened. How sweetly, ghostly, sounded those far-off bells, those strange dream-bells. Not a sound, but their thin beauty dying and growing and dying again! And there she stood and listened 'with the wonder growing in her face.'

'Peace and good-will—peace;' and then she looked at me, and came quickly forward—next moment she was beside me in the sledge.

'She is asleep,' she whispered. 'I think she will get well.'

'Then let us get home,' I answered; and that was all.

Jangle, jangle, jangle went the sleigh bells; and once more we moved through the silent world. But we went slowly now. Why? Was it because of the surrounding stillness, which one feared to disturb? Or was it because my whole soul was filled and thrilled with the knowledge of her nearness, with the knowledge that here were she and I alone in this sleeping—this dead world: the only living creatures in this great silence?

Slower and slower went the horses; and yet the road seemed to melt before us; and ever nearer came 'home' and parting. But yet we did not speak. The sweet precious moments slipped by; and once more my heart came alive and beat and throbbed and suffered. I longed to throw myself down in the snow before her and humble myself utterly, if only, by my doing so, we might be again as once we had been. But still I could not do it. She had been wrong too. She *must* meet me half-way. Oh! she must feel it. Why would she not confess it? Could she not see how much braver, nobler, worthier of herself it would be than this indifferent unconcern, this obstinate silence?

'I've dropped my muff,' the clear voice suddenly said quietly.

I started as if I had been shot, and came back from my world of thought to gaze with uncomprehending eyes on the sweet face at my side. How sweet it was, how calm, how contented! Why was it not full of shame and contrition? It ought to have been; but no, not a bit of it! The blue eyes were looking up at me with the utmost friendliness; the rosy mouth had a smile on it.

'Please,' she cried—'please, stop the horses. I've dropped my muff.'

I stopped the horses.

'Will you please get out and find it for me?' went on the purring voice. 'I will hold the horses.'

'I may not be able to find it in the dark,' said I. 'It is white like the snow.'

'It's whiter,' she answered, still smiling.

I got out, and strode along the way that we had come. My heart was vexed within me; for I knew she had dropped that wretched muff on purpose that she might order me to go back and fetch it.

At that moment my foot touched something soft. The little white muff! I picked it up; and something dropped out. I stooped and lifted it from the snow. A glove! Such a little glove! Not thinking what I did, I spread it out on my broad palm and laughed a bitter laugh as words that I had read somewhere came to my mind, 'That hand withal looketh somewhat soft and small for so large a will in sooth.'

I walked back to the sledge. The lamps were shining with two golden eyes over the snow: the horses' bells were jangling; but the little white lady was sitting very still. I came to her side of the carriage. What a great fellow I seemed! for, standing there on the road, my head was on a level with hers as she sat in the sledge.

I held out the muff. She did not take it. Her face was turned away. Was she crying? Was that why she kept her face hidden? Was she ashamed at last? This was well, ah! this was well. I was glad she had come to see the error of her ways. She had taken a long time about it, certainly; but still I would be generous; I would pardon her at once.

I still held the muff out. 'Avis, this is your property.'

'Which!' and a face, not bathed in tears, not blushing with shame, but sparkling and dimpling with laughter, was turned to mine. 'Which?' she repeated, looking at me with a world of mischief shining in her eyes.

'This,' I said severely—but my hand shook.

'Oh! is that all?' she said, taking the white fluffy thing in one hand very slowly and looking in my eyes all the time; while gradually a warm little bare hand stole out from under the wraps. 'I thought you meant *this*'—and the warm little hand was about my neck.

For one wild moment I tried to remember my anger; but the shining eyes were still smiling into mine; and next moment the laughing mouth was warm on my lips.

Ah! well, who could have resisted it? In an instant my arms were about her, and I was straining her to my heart.

How could two young people who loved each other have been so foolish?

A FEN PARISH.

Four miles north of Spalding, which its good folk are pleased to dub the 'Metropolis of the Fens,' lies the village of Surfleet, Lincolnshire. Close by the parish church, which stands beside the main highway from Spalding to Boston, flows the river Glen, the principal affluent of the Welland, which it meets two and a half miles to the east of the village. Below the confluence, the sluggish Welland used formerly to find its way to the Wash through wide marshes, that at seasons of high tide were covered with the inflowing sea.

Two hundred years ago the inhabitants of this parish elected every Easter, in addition to the churchwardens, overseers of the poor, surveyors of highways, and constables, the usual parish officers everywhere, also an ale-taster, a swine-

ringer, a pinder and field-tenter, a marsh shepherd, a marsh reeve, and two dike reeves. The ale-taster—called also ale-conner—was appointed to assay or test the strength and quality of the beer brewed by the brewers. If it was below the standard, he ordered it to be sold at a price lower than that fixed by law for good beer. The duties of the swine-ringer were to see that the owners of swine 'ringed' them properly—that is, put an iron nail into their noses, to prevent them from rooting up the turf. At that period, large herds of swine seem to have been kept, chiefly on the open common-land of the parish. The roads, too, were wide, and had broad grassy margins. The pigs, therefore, if not ringed, would have done damage to the turf by ploughing it up with their snouts. The Court of the Duchy of Lancaster, which had jurisdiction over the fens or part of them, issued a special code of laws or orders to regulate the use of common right and pasturage. One of these orders was to the effect that 'No swine were to be put in the Fens unringed.' The churchwardens' account-book shows the great amount of damage that swine sometimes did to the roads in the following entry in the year 1771: 'To two days filling in the swine rootings and cleaning the roads in several places, three shillings.'

The pinder had charge of the pound or pinfold, into which all cattle, sheep, horses, or swine that were found straying on the roads were put, and detained until claimed and ransomed by their owners. In 1697 this official was empowered to charge 'for every horse, twopence; for every beast, twopence; for every swine, fourpence, for every time that they shall trespass in the open fields of Surfleet; and for every score of sheep, fourpence.' Thus every pig was accounted as troublesome as two horses or two beasts, or even twenty sheep.

The marsh shepherd was elected by the inhabitants—that is, the farmers and owners of stock—to take charge of their sheep that were sent to be grazed on the Welland marshes. He was paid for his trouble all through the eighteenth century at the rate of four shillings a score for sheep, and one penny a piece for lambs, for the year.

To the marsh reeve was entrusted the important duty of maintaining the sea-banks, and keeping watch upon them in times of high tide or heavy rains, when the inland streams and channels were swollen with water. The office was of course one of great responsibility. The bed of the river (Welland), and the beds of the drainage water-courses that emptied into it, were in many cases higher than the level of the adjoining lands; and their waters were only kept in by high grassy banks. Consequently, any neglect of these banks exposed the entire district to inundation. In 1777 the marshes were enclosed, and about the same time the river was deepened and its channel improved; since then, the marsh reeve has acted as factor, or steward,

or bailiff for the inhabitants of the parish in respect of that portion of the marshes which was assigned to them in common ownership.

The dike reeve—in the Fens the ditches are called 'dykes' or 'dikes'—were, and are, officers appointed to inspect the parish drains, sewers, and dykes connected with the artificial drainage-works of the district. They were charged to keep them free from weeds and reeds, to preserve their sides or banks in good order, to maintain the efficiency of the tunnels and bridges and sluices, and let in the water from the rivers, or shut it out, according as occasion might require. Every year, between the 1st of September and the following 25th of March, they 'rode the sewers' and larger ditches or drains—a duty which engaged one man for eight days. This was for the purpose of inspecting them preparatory to presenting their annual Report before the nearest Court of Sewers at Boston. The dike reeves were allowed five shillings each for every day spent in 'riding the sewers.'

The account-books of the parish are full of entries for matters peculiar to a Fen parish, such as payments for cleaning out dykes; heightening and repairing river-banks; watching the water night and day in times of flood; maintaining banks, bridges, tunnels; opening the outfalls of drains and other water-courses choked up with mud; 'cradging' banks—that is, heightening and backing them temporarily with clay, to prevent the water running over them or percolating through them—and such-like things, as well as for purchasing timber, thorns, bricks and stones for making and repairing these various drainage-works.

On these wide marshes travellers were sometimes belated and drowned; nor were the natives themselves exempt from fatal disasters on them. The seamen, shepherds, wild-duck hunters, fishermen, fowlers, and others whose callings took them on those lonely expanses, were occasionally overtaken by the waters and lost. Whether the following entries in the parish registers refer to cases of this nature is not stated; it is probable that they were: '17 $\frac{2}{3}$ February 16, Wm. Foresigh, a Scotchman of the parish of Middleby, in the county of Annandale, buried; and '1729, April 18, Dunkin Camoll, Passenger, of Stirling-bridge, in Scotland, buried. These entries were evidently made by one who was no great adept at spelling, and spelt phonetically; the names are presumably 'Wm. Forsyth' and 'Duncan Campbell.' Another parish functionary there was who should be named—a dog-whipper, to whip the dogs out of the churchyard; he was in receipt of an annual salary of twenty-one shillings for performing the no doubt onerous duties of his office. The payment, though not the name, was continued until past the middle of the present century.

Here are some 'curiosities' from the records of the parish. A payment of one shilling to this or the other person for 'killing an otter,' and the same sum for 'killing a fox,' are frequent items between 1753 and 1780. Under Christmas Day, 1760, stands, 'Paid for a foxes foot, one shilling.' Under 1759, 'For carrying the Command^{ts} to Donington, four shillings;' and 'For the Command^{ts} coming home, four shillings.' Not that Donington, a town six miles distant, was above

all its neighbours godless and wicked, and Surfleet especially holy; the reference is no doubt to some painted or printed copy of the Ten Commandments, such as frequently hang on church walls, which was sent to Donington to be repainted or mended.

The following entries seem to indicate that the inhabitants of Surfleet were certainly not holy above their fellows, but, on the contrary, lawless, fond of wanton mischief, and given to rough practical joking: '1762, April 11th. Spent sixpence upon Jno. Perkins for helping me to set a boy in y^e stocks;' several items for locks for the churchyard gates and the various doors of the church; for new gates on more than one occasion; a reward 'for getting back the churchyard gates;' 'for pulling the churchyard stones out of the river [Glen], sixpence;' and 'the constables to be allowed one guinea for putting a stop to the nuisances on a Sunday by boys and men playing at marbles and chuck, and people getting drunk on the Sabbath, or any other disorderly conduct' (March 25th, 1828). 'Ale for washing the church when cleaned one shilling' reads very funnily; the ale was of course wanted not for washing the church, but for washing the throats of those who washed the church.

During the first half of the present century sparrows seem to have been a plague in Surfleet; at a vestry meeting held on the 26th of March 1840, the surveyors of the highways were empowered to purchase them at the rate of one penny per dozen eggs, twopence for young birds, and fourpence for old birds; and at a still earlier date the contractor for the poor in the poorhouse was expressly relieved of the expense of destroying them. April 7th 1801. 'At this meeting [of the vestry] the question was put whether the ringing days shall be continued, the ringers [who received 10s. 6d. to 12s. 6d. a day] not doing their duty. The voices were as follows: ayes, 6; noes, 13.' The churches of the Fens are noted for their fine rings of bells.

THE MONTH:

SCIENCE AND ARTS.

THE United States Consul at Nassau has recently reported in a very interesting manner upon the sponge-trade of the Bahama Islands, an industry which employs between five and six thousand persons, the majority of whom are blacks. The sponges are dragged from their beds by means of long poles, to which are attached iron hooks, after their locality has been ascertained by means of a water-glass. This contrivance consists simply of a wooden box about nine inches square with a plate-glass bottom. When floated on the water, this apparatus will enable a person looking into it to see plainly objects at the bottom of the sea, even though they be three or four fathoms distant. An attempt, some years ago, to do away with this primitive system of obtaining sponges by the introduction of dredges was frustrated, for it was feared that the new method would have the effect of extirpating the sponges. It is not known exactly how long a sponge takes in growing to a marketable size, and there are many

contradictory opinions on the subject; but it appears that from twelve to eighteen months is approximately correct.

A new form of wood-paving is now being put on its trial in the streets of Paris. Oak-blocks four inches in depth are split up as if they were intended for firewood, and are laid loosely on end upon a foundation of sand. Sand is then thrown over them, so that all crevices are filled up, and a layer of finer sand is covered over all. The roadway thus made is alternately beaten and watered, the moisture causing the wood to swell, and so compressing the materials into a homogeneous mass. It is claimed for this description of paving that it will last a long time, and will sustain the heaviest traffic without giving way.

Some experiments have lately been reported as having taken place in France with the object of determining the effect of electricity upon the growth of plants. The apparatus used was simple enough, for it consisted only of a zinc plate and a copper plate placed one at each end of a seedbed and connected above by a copper wire. A row of hemp grown in the electrified seedbed produced stalks which were forty-three inches longer than those of plants growing under normal conditions. Potatoes nearly doubled their output of tubers under the influence of the current, while tomatoes were made to ripen eight days earlier than those to which no electricity was applied. These results, if correctly reported, are very extraordinary, but confirmation is needed.

It is a matter of common knowledge that during the initial stage of a fire a very small quantity of water is sufficient to extinguish it, hence it has become usual to place in buildings various forms of extinguishing apparatus, from the humble bucket to the elaborate chemical contrivance charged with carbonic acid. But in the case of the buckets it is too often found at the critical moment that they have become half empty by evaporation. A noteworthy improvement in such apparatus is exhibited in Messer & Thorpe's Patent Bucket and Fire-extinguisher. The peculiar feature of this invention is that the buckets are kept in a kind of square tank, which may be made ornamental if desired, and that they telescope one inside the other to the number of twenty or more, and are always full of water; that is to say, the tank is of such a size that it holds a little more water than the capacity of the twenty buckets. These fit one inside the other; and at an alarm of fire, the lid of the tank would be opened, and the buckets taken out one by one, each being quite full of the liquid. Apart from the efficiency of this system, it is a great advantage that the buckets should be hidden away in the manner described. The invention was shown at the recent Naval Exhibition, and attracted much attention.

Another invention of quite a different kind was shown at the same Exhibition during the last few weeks that it was open; this is Kelway's

Marine and General Electrical Signalling Apparatus. This contrivance consists of a frame or shallow box which can conveniently be about six feet high by four feet in breadth. It contains fifty incandescent electric lamps, connected in such a manner that part of them can be illuminated at the will of the operator. Upon a small keyboard arrangement is provided a button for each letter of the alphabet, and on pressure of the particular button denoting the letter, certain lamps in the box forming that letter are illuminated. In this way luminous signals which any one can understand can be rapidly spelt out. Such a box can be affixed to the rigging of a ship or against any building on shore, or in any other situation desired. The apparatus acts perfectly; and the letters being six feet in height, can be read from a very great distance. The electric lamp has now become so common that there would be no difficulty in any large town, or indeed on shipboard, in finding the necessary current to furnish the energy for this excellent method of signalling. It is evident that the letters can be made to spell words direct, or any form of private code could be used.

A correspondent of *Nature* describes a method for the destruction of mosquitoes which we believe is not commonly known; and he tells us of an English resident on the Riviera who had freed his property from this pest. Fresh water on the Riviera, as many of our readers well know, is scarce, and therefore it is treasured accordingly. The inhabitants store it for use in tanks and other receptacles. Now, the larvæ of the mosquito, it is asserted, can live only in fresh water, and the carp happens to be a fish which is particularly fond of that larvæ as an article of diet. The gentleman referred to exterminated the insects by the simple device of placing a pair of carp in each tank attached to his premises. We feel certain that there are many places abroad where the conditions are similar and where this experiment might be tried with advantage.

A new method of brickmaking has been invented by Mr Kennedy of the United States, and a company has been formed to work the patent in this country. The brickmaking machine was recently shown at Southall, and proved in a conclusive manner the efficient nature of the process. The most noteworthy feature in this mechanical brickmaker is that the clay is used perfectly dry. After being reduced to powder in a disintegrator, it is strained through a sieve, and then falls into the hopper of the machine, the coarse particles being returned to the disintegrator to be reduced once more. From the hopper the powdered clay is fed into moulds, which are four in number, and a pressure of one hundred and sixty tons is then brought to bear upon each. This is equal to about one ton per square inch, and this great pressure is secured by compound levers of the first order. When the bricks so made leave the moulds they are very hard and compact, and they are at once taken away to the kiln to be fired. The machine is strictly automatic, self-feeding and self-discharging, and the work being done under shelter, can go on all the year round without interruption. The machine in question has an output of twenty thousand bricks per day of ten hours.

Long before the gelatine dry plate had fur-

nished photographers with a means of taking so-called instantaneous pictures, a collodion dry plate had been employed, and although its qualities were good, it possessed the demerit of extreme slowness, and so its use was discarded. Two years ago, at the Birmingham Photographic Convention, Dr Hill-Norris announced that he had succeeded in producing a collodion dry plate which rivalled gelatine in rapidity; and he promised at that time that the new plates should be presently placed upon the market. We now learn that this promise is to be fulfilled in a very few weeks, and photographers are looking forward to the revival of an old process which had several advantages, and which may possibly prove a formidable rival to the more modern form of photographic dry plate.

The English sparrow is regarded in certain transatlantic towns in much the same way as the English rabbit is looked upon in Australia and New Zealand. In other words, he has been so prolific that he has become a nuisance; and many sufferers have endeavoured to invent the best means of destroying him. In one of the American papers it is advocated that the sparrows should be exterminated by the administration of poisoned food; and the method recommended is to soak grain in strongly sweetened water and then to sprinkle dry arsenic upon it. But the sparrow is such a cunning bird that he must be tempted for a few days to the food by spreading unadulterated grain in a certain locality, to which he will gradually become accustomed. This grain can afterwards be replaced with the poisoned variety to the discomfiture of the poor birds.

It has often been complained that the use of modern explosives in mines leads to the production of such poisonous fumes that a grave danger to the workmen is thus incurred. A short time ago a Committee was appointed by the Durham Coal-owners' Association, consisting of representatives of both masters and men, to consider this important question. Careful experiments having been made, the Committee came to the conclusion that the fumes produced are not more dangerous than those from gunpowder; that carbon monoxide—the irrespirable gas which is produced by the combustion of charcoal, and which has led to so many deaths—is present only in traces; that an interval of five minutes should be allowed to elapse before the men re-enter the gallery in which the charge has been fired; and that as they find a portion of the deleterious gases are due to the fuse employed, the charges should be invariably fired by electricity.

Telegraphic wires in China are invariably placed under ground, and the reason why the familiar poles and aerial wires to which we are so accustomed in this country are not adopted in the land of the rising sun is a curious one. There are no cemeteries or burial-grounds in China, each family providing for the sepulture of the dead upon its own premises. Dead ancestors are held in such peculiar reverence among the Celestials, that a shadow cast upon the grave of such is looked upon as an insult that must on no account be passed over. It was found that when the first Telegraph Company began to put up poles on which to hang their wires, that the shadows of these poles were sure at some time of the day to fall upon the grave of somebody's

ancestor, and there were constant disputes between the workmen and the inhabitants. The men, in fact, could not get on with their work; and being unfamiliar with the Chinese language, were unable to understand what the uproar meant which their work occasioned. The Government was then appealed to, and the secret came out; thenceforward, for their own protection, the company were forced to lay their wires below ground.

The *Papermaker* reminds its readers that in the International Exhibition of 1891 a specimen of iron paper was shown. This led to some competition among iron-masters as to the thinness to which cold iron could be rolled. One maker produced a sheet of paper so thin that eighteen hundred layers of it piled upon one another measured only one inch in thickness. The fineness of the iron-foil referred to may be understood when it is remembered that twelve hundred sheets of the thinnest tissue-paper arranged in the same manner measure a fraction more than one inch in thickness. The iron paper was perfectly smooth and easy to write upon; but when held up to the light, it was porous. We are not aware of any practical use to which iron paper could be put, for, owing to its liability to rust, it would be far inferior to the paper that we are accustomed to.

Oranges, figs, olives, and grapes are now freely grown in Australia, and find their way to most European countries. It is reported that a Greek gardener has expressed the opinion that the colonial fruit is inferior in quality to that grown at Smyrna and Athens. This report having been brought to the notice of the Department of Agriculture at New South Wales, the British consuls at Naples and Marseilles were appealed to for a consignment of the best varieties of grapes, figs, and olives grown in Italy and France; and when the cuttings arrive in Australia, experiments are to be carried out at the various stations throughout the colony with a view to produce the finest possible varieties of the respective fruits.

It is often desirable to relieve the tedium of travelling by rail by testing the speed at which the train is running along, and many persons amuse themselves by timing this speed by noting, watch in hand, the time at which the various mile-posts are passed. There is a rule, however, which gives approximately correct results, which any one may practise without reference to a time-keeper. The rails average about thirty feet in length; and the number passed over in twenty seconds equals, roughly, the number of miles per hour at which the train is travelling. Unless the train is running at a very high speed, say over sixty miles per hour, there is no difficulty in counting the number of rails passed over, as there is a distinct click as the joint between each pair of rails is covered by the wheel.

A great deal of misconception exists with regard to the actual speed at which a modern locomotive engine can travel, and wild statements have lately been made as to the wonderful pace at which posterity will glide along the rails. Mr Stretton, C.E., speaking at Leicester recently, gave a statement of the highest speeds yet attained, and places the limit at eighty miles per hour. At this speed, he tells us, the resistance of the air and the back-pressure in the cylinders become so

great that they absorb the whole power of the engine. It is then useless to attempt to still further open the regulator and try to go faster, as the back-pressure instantly increases, as the exhaust steam cannot be got out of the cylinders fast enough.

Mr Maxim, whose name is well known in connection with the machine gun which bears his name, is now engaged upon the construction of a novel flying-machine, the completion of which must be looked forward to with great interest. This flying-machine, or ship, will measure about eighty feet long by thirty feet in breadth, and is mostly made of extremely thin but strong steel plates. The motive-power will be steam generated by some hydro-carbon such as petroleum. The machine will differ from all others previously devised in dispensing altogether with the balloon principle; in fact, it will resemble more than anything else a huge kite. Whether it will succeed is an open question, about which many doubts must exist; but there is no doubt that its inventor believes in it and will carry it to completion.

We have constantly to record the utilisation of waste products, and it is always an agreeable task to do so, because it is evident that such utilisation means a distinct gain to the wealth of the country. The last invention of the kind must be credited to Mr W. L. Brookway, who has pointed out a way to save the waste tin plate from the cans, cases, and other receptacles for preserved foods which now find their way into every household. The tins are first heated in a special form of furnace, and it is stated that in about three or four minutes the tin and solder are completely separated from the iron which forms the base of the so-called tin plate, and falls to the bottom of the furnace. The iron itself is left in such a condition that, after cleaning, cold-rolling, and annealing, it makes a tough high-class iron plate, which is fit for a number of different applications. It need hardly be said that the separated tin and solder are not the least valuable of the metals saved.

We have heard a great deal recently about so-called hypnotism, and as it is a subject upon which the general public seem extremely ignorant, and one which has led very often to mischievous results, we think it as well to quote the opinion of Dr Calderwood, Professor of Moral Philosophy at Edinburgh. Lecturing a short time ago on the subject of Hypnotism, he said it was merely a new name for mesmerism. With regard to the method of producing the artificially induced sleep, he stated that there was nothing in the nature of electricity or magnetism about it, and, contrary to the general belief, no influence whatever emanated from the body of the operator. The results are really brought about by the tiring of a single line of nerve, and he believed that many people, if not all, were liable to it, but not against their will. The condition during the sleep was akin to the cataleptic state, or the state of the sleep-walker, and he warned his audience against having anything to do with it.

An investigation into the condition of animal life in the depths of the Black Sea has led to a curious discovery. Experiments in this direction have been going on for the past two years, and an interesting Report is now being prepared by the scientists who have been engaged in the work.

From this it appears that from one end to the other of the Sea, the water below a certain depth is impregnated with sulphuretted hydrogen, and in consequence of this no animal life is found below that depth. A satisfactory explanation of this phenomenon has as yet not been found.

A well-known bee-master of the Gironde, Mr Teynac, has conceived the idea of utilising the interesting insects under his care in an altogether novel manner. He has found that they show the same instinct which is exhibited by the carrier-pigeon in returning to their hives from long distances. A bee-line has become an expression which is understood to mean a straight course from one place to another, the little insect flying in this direct manner to its home. Mr Teynac's plan is to attract the wandering bee by means of a saucer of sugar or honey; to take it between a pair of tweezers, and to affix to its thorax a small ticket by means of fish-glue. This ticket might bear microscopic writing, or might indeed consist of a photo-micrograph such as was commonly used during the siege of Paris for conveyance of news by pigeon post. It is not pretended that the bees will cover the immense distances which

the birds are known to travel; indeed, their flight must be limited to perhaps three or four miles. Still, the system might be found useful in the absence of the feathered messengers.

SONNET TO THE NEW YEAR.

FOR ever doth our Mother Earth repeat
Her happy welcome to the young New Year,
Unstained as yet by human sigh or tear.
What marvel his bright presence doth she greet,
And pours her winter treasures at his feet.
On naked branch her frost-gems sparkle clear;
Her snow-wreaths hide the leaves decayed and sere.
All must be beautiful his step to meet,
Who brings again the glory of her youth.
The saddest heart forbears awhile to grieve,
As o'er its threshold steps the fair New Year.
'What gift?' it cries. 'Now answer me in truth.'
The New Year whispers: 'Nay, thy questioning
leave;
My gifts are all from God—then wherefore fear?'

MARY GORGES.

Volume VIII. of the Fifth Series of CHAMBERS'S JOURNAL is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

A cloth case for binding the whole of the numbers for 1891 is also ready.

Back numbers to complete sets may be had at all times.

A NEW NOVEL

THE IVORY GATE

BY

WALTER BESANT

will be commenced in the Part of CHAMBERS'S JOURNAL published at the end of January
which will also contain a complete Story in Five Parts

ENTITLED

SUNSTRUCK.

By G. MANVILLE FENN

END OF THE EIGHTH VOLUME
